

Cloud and aerosol influence on photolysis frequencies during CONTRAST

Samuel R. Hall, Kirk Ullmann

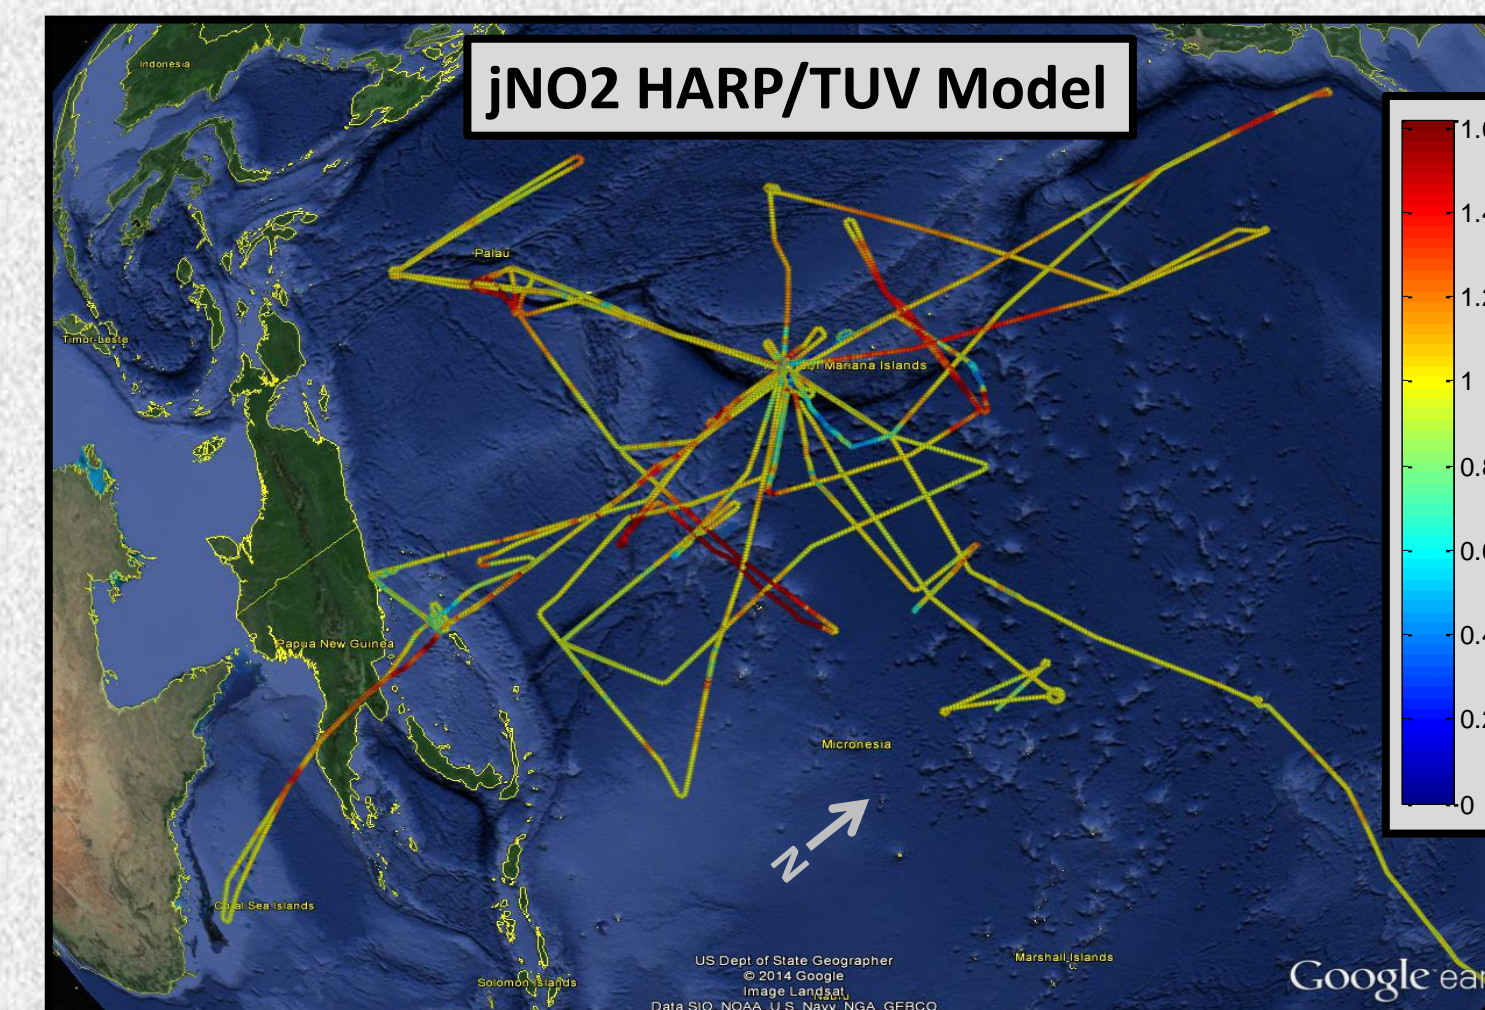

Summary

Clouds and aerosols influence the lifetime of photolytically active chemical species in the atmosphere through scattering and absorption. Below and within optically thick convective clouds, shading reduces the photochemistry thus permitting vertical motion within the cloud to transport short-lived species from the boundary layer to the free troposphere and episodically to the lower stratosphere. Conversely, near highly scattering cloud tops, photochemistry is greatly accelerated. In such rapidly evolving environments, accurate photolysis frequencies are required to study the chemical processes and evolution of distributed species. During the CONTRAST experiment, photolysis frequencies were calculated from measurements of spectrally resolved actinic flux by the HIAPER Airborne Radiation Package (HARP) on the NCAR G-V aircraft. Statistical correlations of the data reveal modal behavior that could help assess cloud fields in global and regional chemistry models.

Active Species in the Tropics

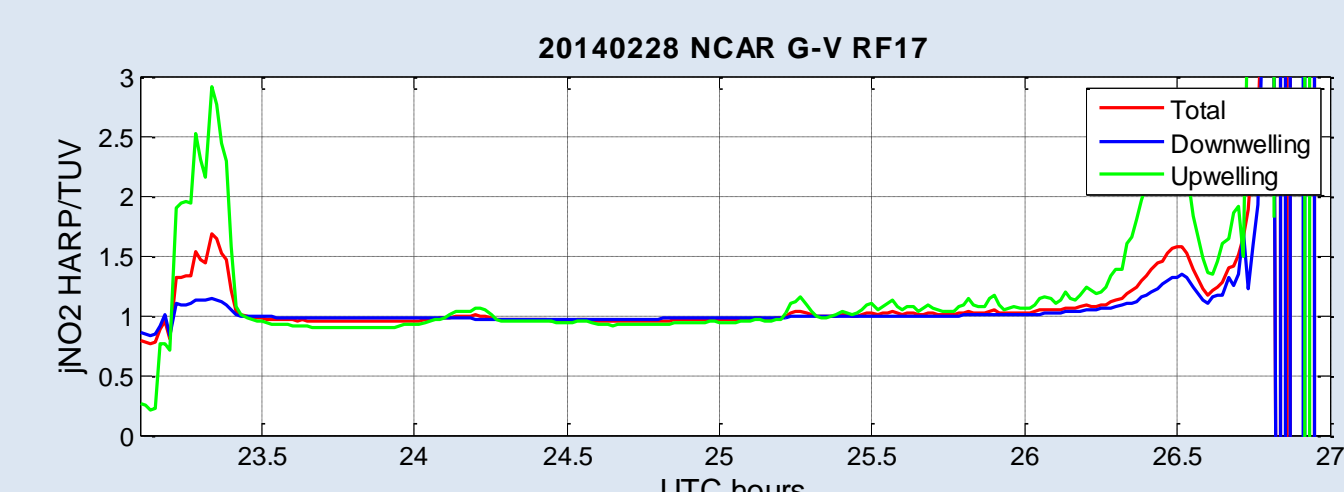

Photolysis Frequencies

- $j[\text{O}_3 \rightarrow \text{O}_2 + \text{O}(^1\text{D})]$
- $j[\text{NO}_2 \rightarrow \text{NO} + \text{O}(^3\text{P})]$
- $j[\text{H}_2\text{O}_2 \rightarrow 2\text{OH}]$
- $j[\text{HNO}_2 \rightarrow \text{OH} + \text{NO}]$
- $j[\text{HNO}_3 \rightarrow \text{OH} + \text{NO}_2]$
- $j[\text{CH}_2\text{O} \rightarrow \text{H} + \text{CO}]$
- $j[\text{CH}_2\text{O} \rightarrow \text{H}_2 + \text{CO}]$
- $j[\text{CH}_3\text{CHO} \rightarrow \text{CH}_3 + \text{HCO}]$
- $j[\text{C}_2\text{H}_5\text{CHO} \rightarrow \text{C}_2\text{H}_5 + \text{HCO}]$
- $j[\text{CHOCHO} \rightarrow \text{H}_2 + 2\text{CO}]$
- $j[\text{CHOCHO} \rightarrow \text{CH}_2\text{O} + \text{CO}]$
- $j[\text{CHOCHO} \rightarrow \text{HCO} + \text{HCO}]$
- $j[\text{CH}_3\text{COCHO} \rightarrow \text{CH}_3\text{CO} + \text{HCO}]$
- $j[\text{CH}_3\text{COCH}_3 \rightarrow \text{CH}_3\text{CO} + \text{CH}_3]$
- $j[\text{CH}_3\text{OOH} \rightarrow \text{CH}_3\text{O} + \text{OH}]$
- $j[\text{CH}_3\text{ONO}_2 \rightarrow \text{CH}_3\text{O} + \text{NO}_2]$
- $j[\text{CH}_3\text{COCH}_2\text{CH}_3 \rightarrow \text{CH}_3\text{CO} + \text{CH}_2\text{CH}_3]$
- $j[\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO} \rightarrow \text{C}_3\text{H}_7 + \text{HCO}]$
- $j[\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO} \rightarrow \text{C}_2\text{H}_5 + \text{CH}_2\text{CHOH}]$
- $j[\text{HO}_2\text{NO}_2 \rightarrow \text{HO}_2 + \text{NO}_2]$
- $j[\text{HO}_2\text{NO}_2 \rightarrow \text{OH} + \text{NO}_3]$
- $j[\text{CH}_3\text{CH}_2\text{ONO}_2 \rightarrow \text{CH}_3\text{CH}_2\text{O} + \text{NO}_2]$
- $j[\text{Br}_2 \rightarrow \text{Br} + \text{Br}]$
- $j[\text{BrO} \rightarrow \text{Br} + \text{O}]$
- $j[\text{Br}_2\text{O} \rightarrow \text{products}]$
- $j[\text{BrCl} \rightarrow \text{Br} + \text{Cl}]$
- $j[\text{HOBr} \rightarrow \text{HO} + \text{Br}]$
- $j[\text{BrONO}_2 \rightarrow \text{Br} + \text{NO}_3]$
- $j[\text{BrONO}_2 \rightarrow \text{BrO} + \text{NO}_2]$
- $j[\text{Cl}_2 \rightarrow \text{Cl} + \text{Cl}]$
- $j[\text{ClO} \rightarrow \text{Cl} + \text{O}(^3\text{P})]$
- $j[\text{ClONO}_2 \rightarrow \text{Cl} + \text{NO}_3]$
- $j[\text{ClONO}_2 \rightarrow \text{ClO} + \text{NO}_2]$
- $j[\text{ClNO}_2 \rightarrow \text{Cl} + \text{NO}_2]$
- $j[\text{ClONO} \rightarrow \text{Cl} + \text{NO}_2]$
- $j[\text{BrNO} \rightarrow \text{Br} + \text{NO}]$
- $j[\text{BrONO} \rightarrow \text{Br} + \text{NO}_2]$
- $j[\text{BrONO} \rightarrow \text{BrO} + \text{NO}]$
- $j[\text{BrNO}_2 \rightarrow \text{Br} + \text{NO}_2]$
- $j[\text{CHBr}_3 \rightarrow \text{Products}]$
- $j[\text{N}_2\text{O}_5 \rightarrow \text{NO}_3 + \text{NO}_2]$
- $j[\text{CH}_3\text{CO}(\text{OONO}_2) \rightarrow \text{CH}_3\text{CO}(\text{OO}) + \text{NO}_2]$
- $j[\text{CH}_3\text{CO}(\text{OONO}_2) \rightarrow \text{CH}_3\text{CO}(\text{O}) + \text{NO}_2]$
- $j[\text{CH}_2=\text{C}(\text{CH}_3)\text{CHO} \rightarrow \text{Products}]$
- $j[\text{CH}_3\text{COCH}=\text{CH}_2 \rightarrow \text{Products}]$

Comparisons to TUV clear sky model

Very clear sky over the Pacific ocean after ascending through a cloud on the return transit flight from Hawaii to Colorado.

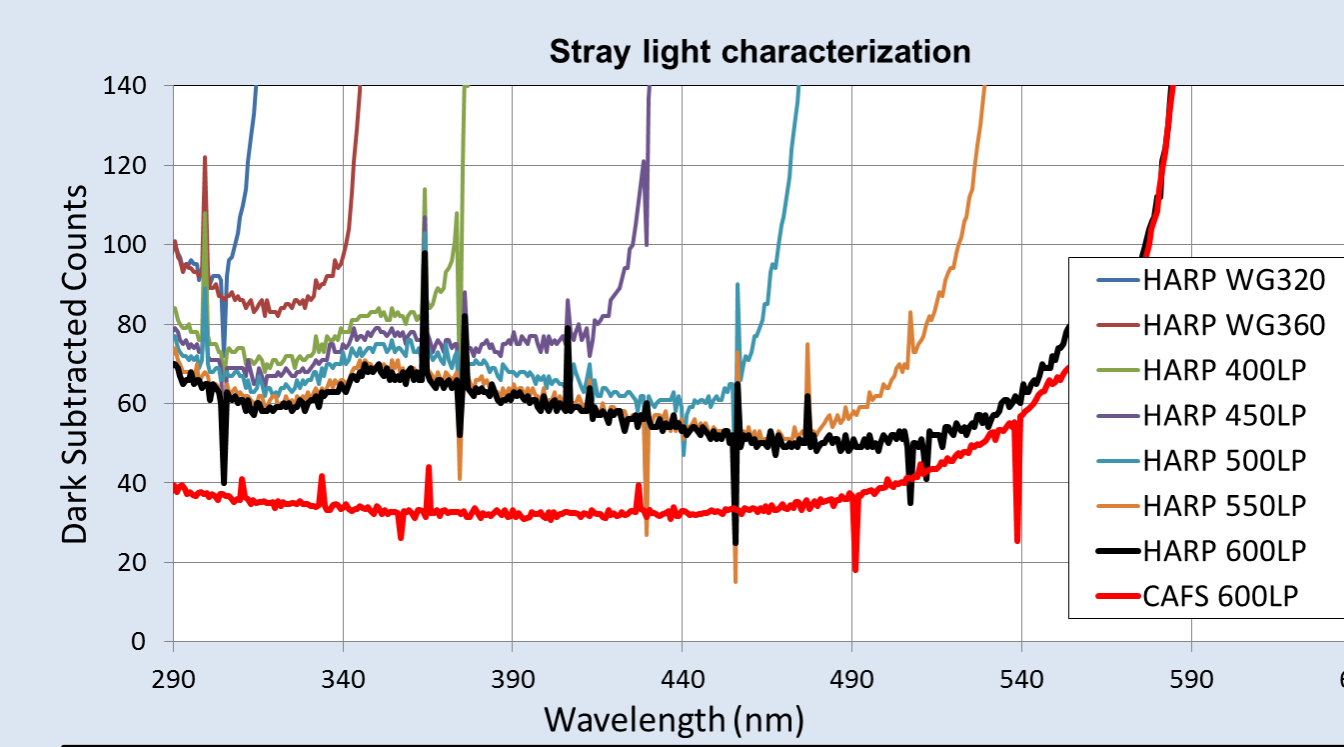

Ratio of measurement/clear-sky TUV radiative transfer model showing excellent agreement with jNO2 and jO3 downwelling. jO3 upwelling differs by 30%.

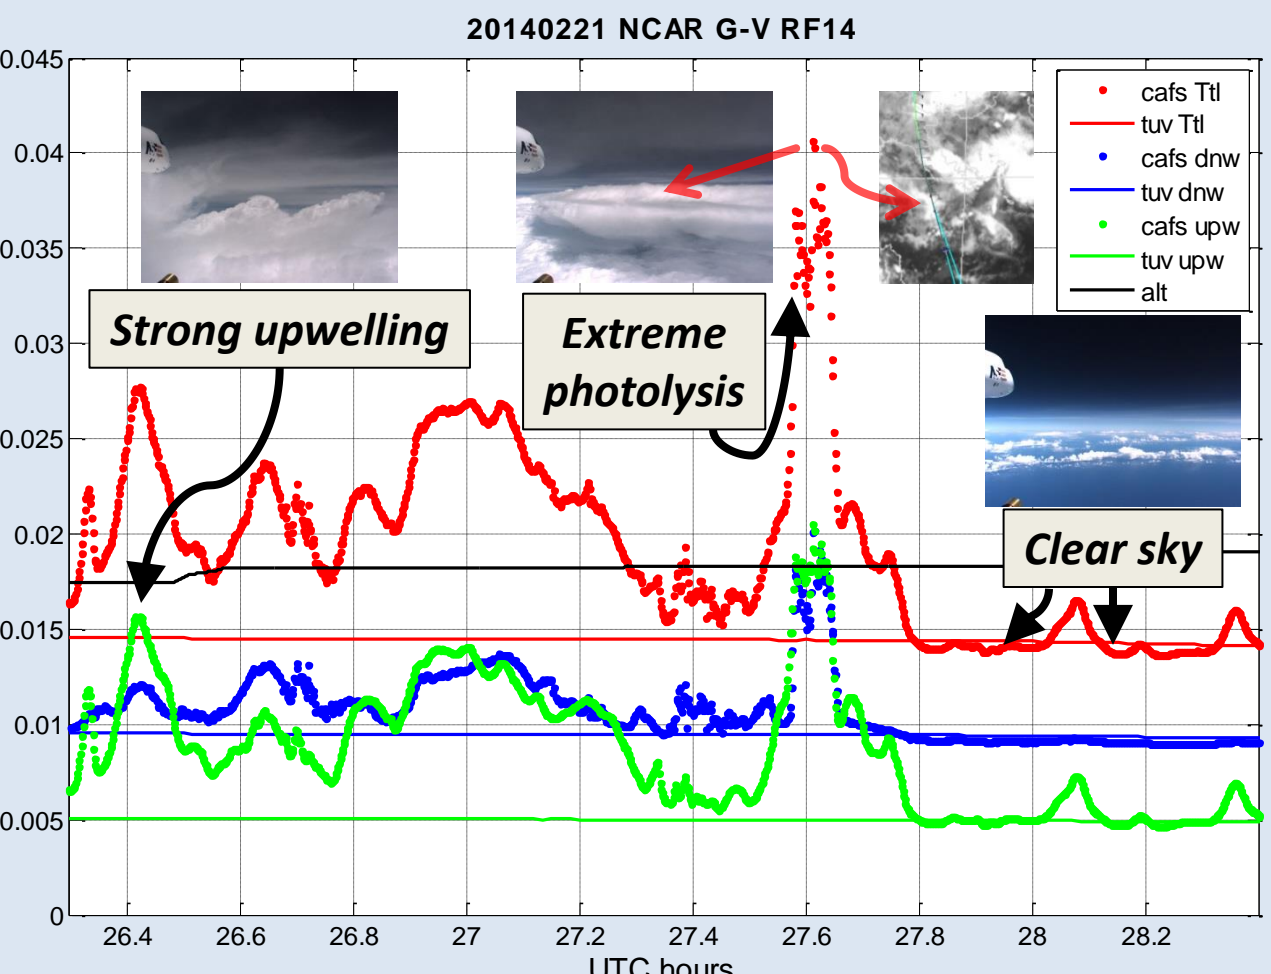

Instrument Characterization

Determination of instrument wavelength offsets by comparison to features in the extraterrestrial solar flux spectrum (Slaper et al., GRL 22, 1995).

Laboratory stray light characterization by long pass filter analysis used to assign spectral corrections. Note the structure in HARP that is not evident in the CAFS system.

Radiative Encounters: Strong upwelling with clouds below and to the side. Extreme photolysis values within a high cloud. Very clear sky outside of the cloud systems

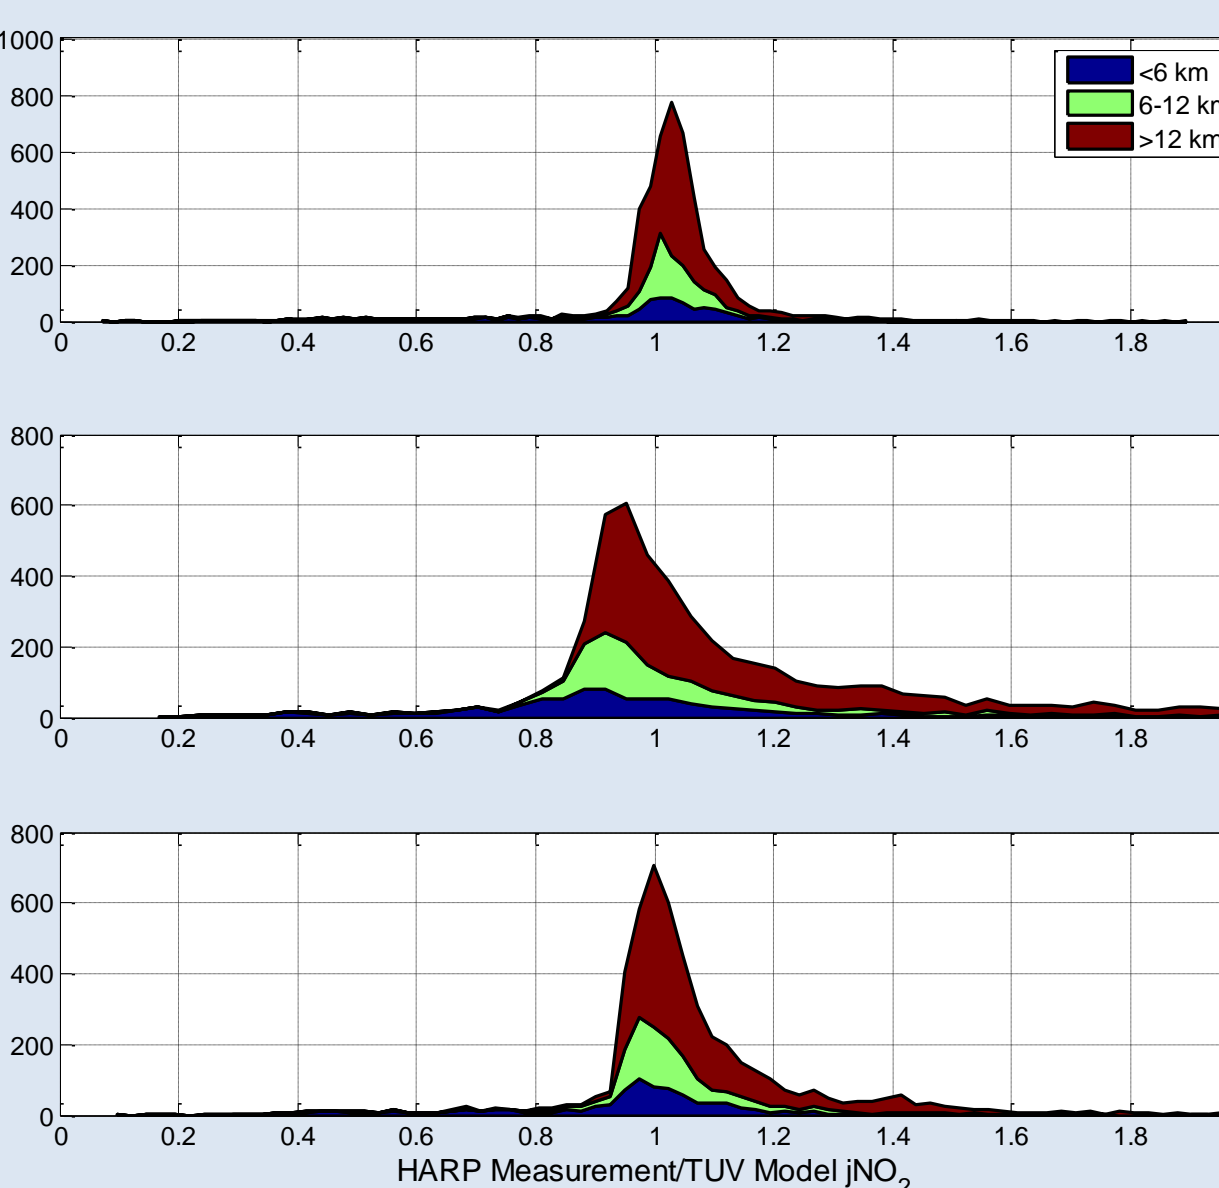

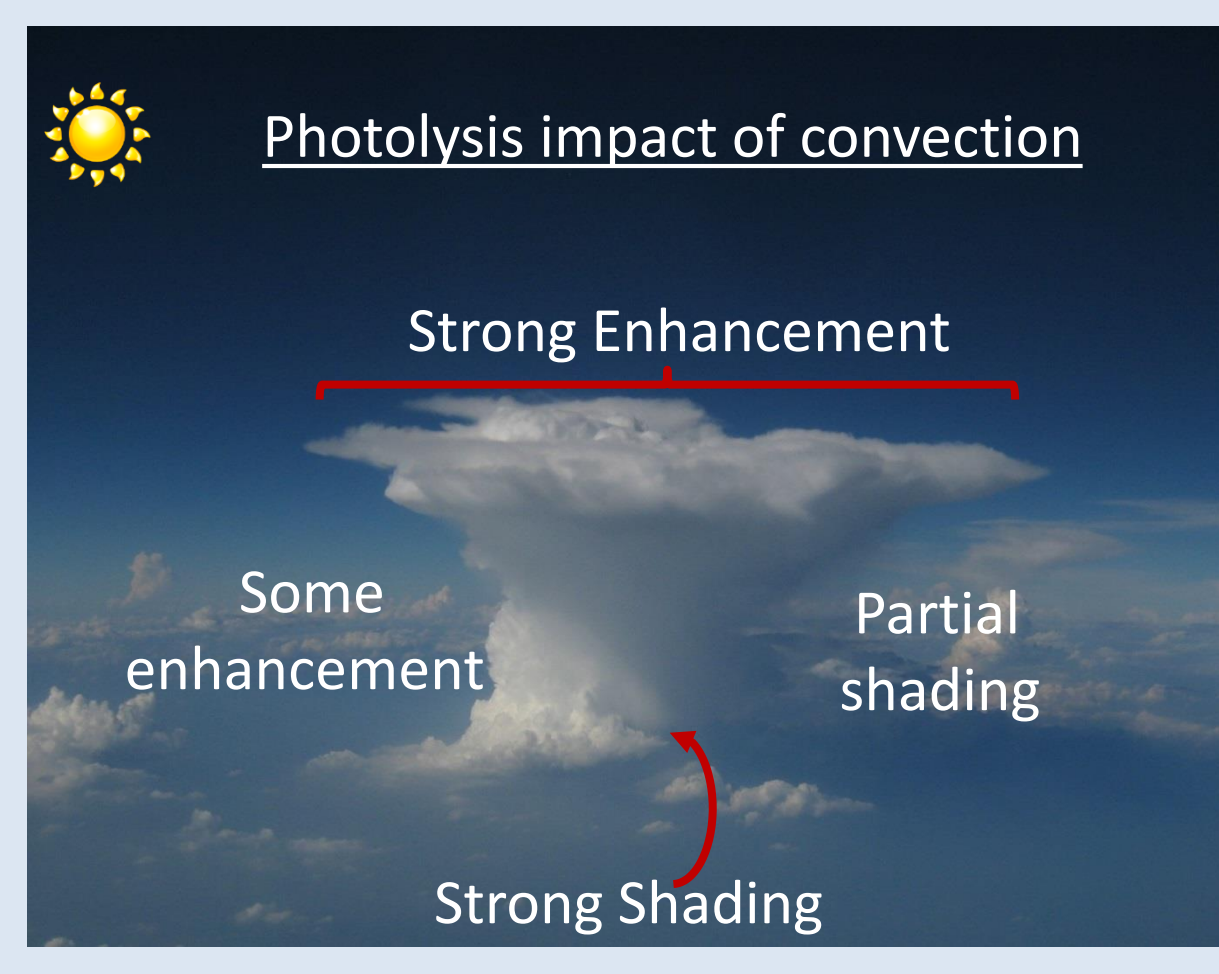

Profiles of jNO2 measured and clear-sky modeled components as the G-V ascended through a thick cloud showing the transition from suppression to enhancement.

Angular response of the zenith optic optimized for a hemispherical response. Azimuthal response not shown.

HARP field calibration history indicating instrument stability throughout the campaign.

Histogram of all measured/clear-sky modeled components for the entire mission. Downwelling was slightly enhanced, upwelling was slightly suppressed.

Clear-sky Model Comparison

HARP/CAFS and TUV provide independent up and downwelling actinic flux components. The plots correlate measurement/model component ratios color coded by altitude. Cloud morphologies result in modal behaviors exhibiting enhancements and reductions (see Palancar et al., ACP, 2011) with some altitude dependence.
