

Status of Radiometer Data Processing from CSET

Julie Haggerty, Kelly Schick, Tom Baltzer
NCAR

CSET Science Team Meeting
14-15 June 2016
Boulder, CO

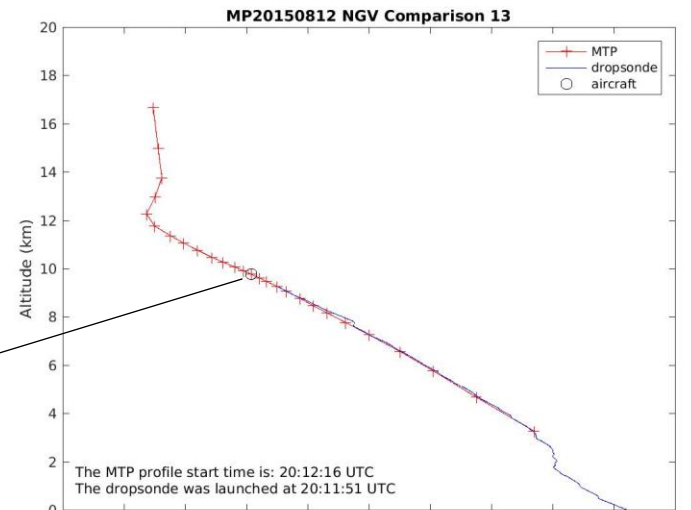

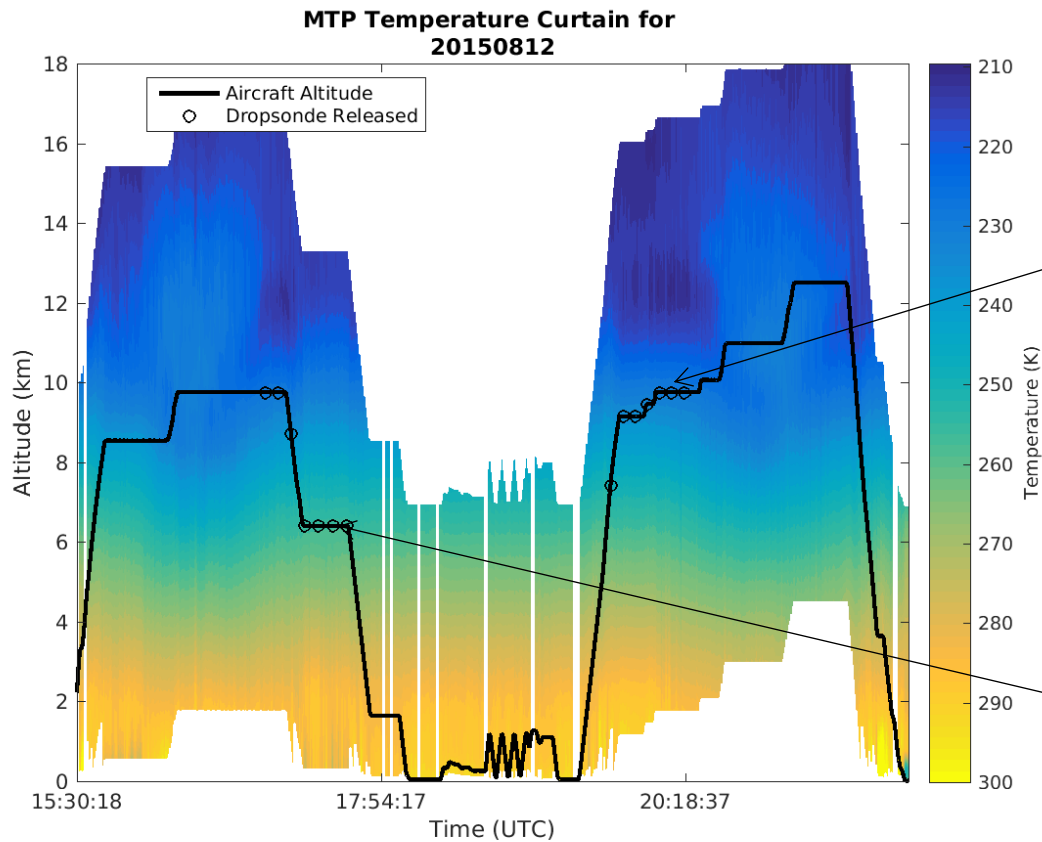

MTP Data Set Overview

- Operated on all research and ferry flights
- Overheating issues forced manual shutdown during low-level ascents
- Intermittent (additive) noise observed on several flights
- Low-level flight segments introduced sea surface emission into measurements; current retrieval method not configured to account for this signal

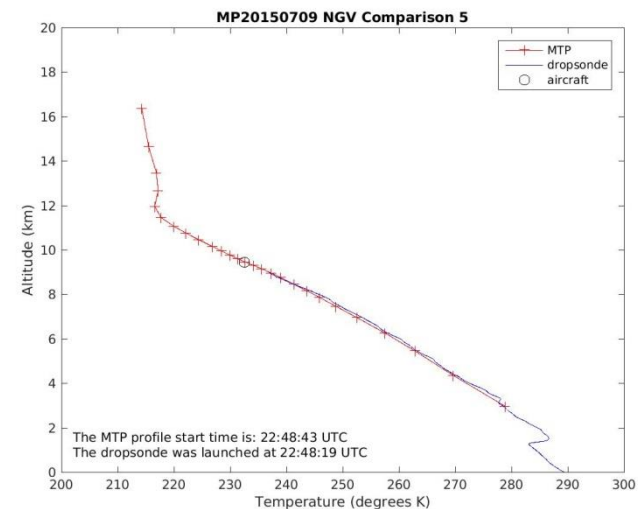

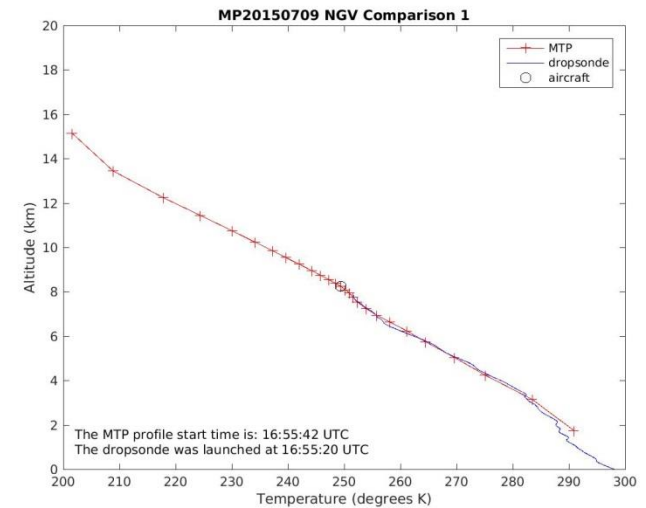

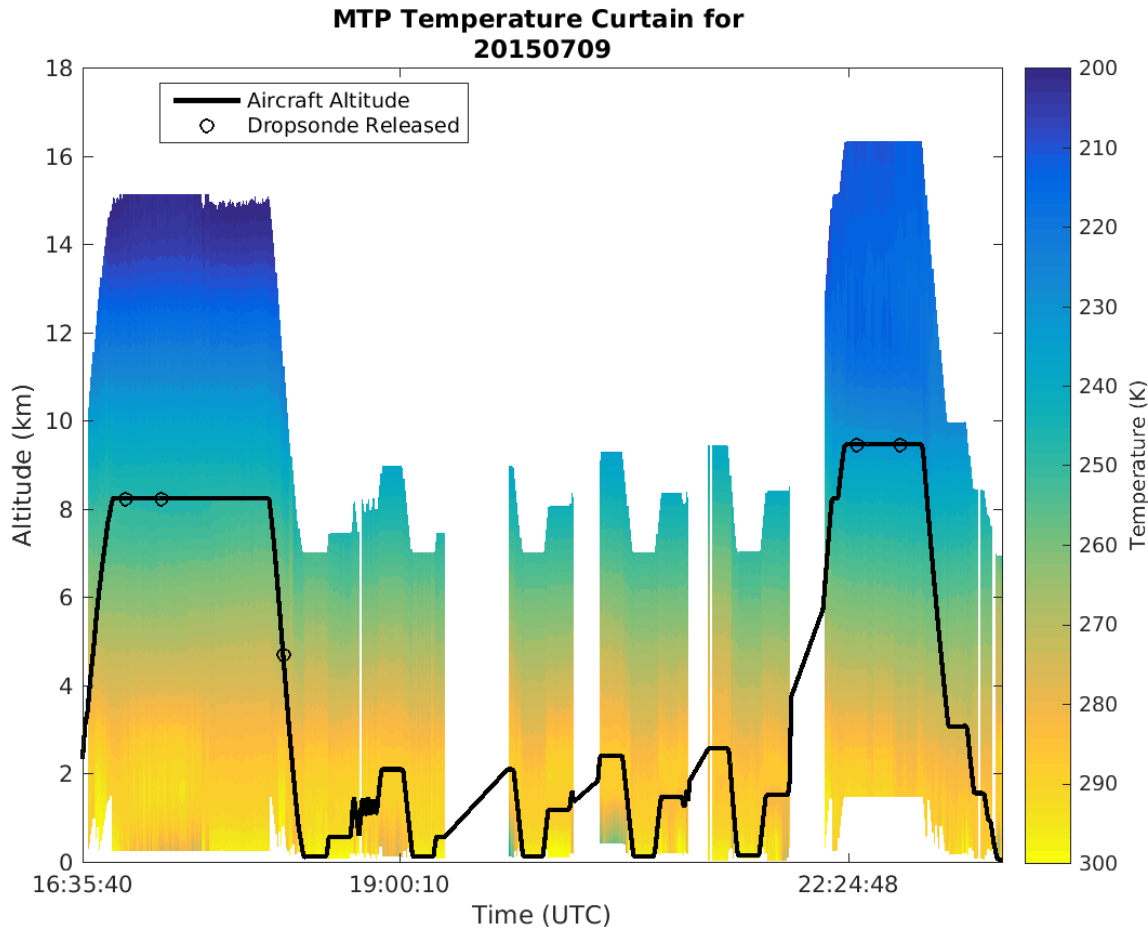

Data Processing Summary

- 16 research flights processed
 - Data not yet released due to continuing investigation of noise issue and effect of surface emission on low level temperature retrievals
- Good retrievals at higher flight levels
 - Based on comparison with dropsondes
 - Some warm bias in lower troposphere (~20% of scans)
- Still investigating retrieval anomalies at lowest flight levels

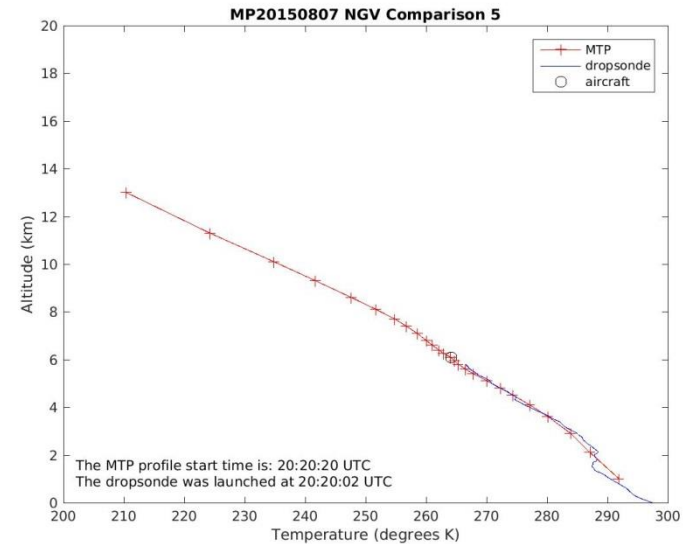

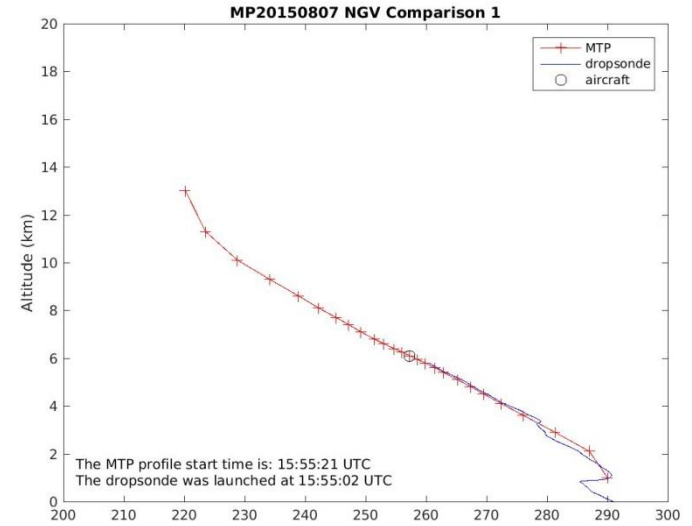

RF16 – 12 Aug 2015

RF03 – 9 July 2015 (KOA to MHR)

RF14 – 7 Aug 2015 (MHR to KOA)

Ongoing Work on CSET Data Set

- MTP currently at JPL for maintenance
 - Intermittent noise observed in lab; source not yet identified, also investigating possible interference from HCR
 - Working on filter to apply to affected CSET data
- Current statistical retrieval method has limited ability to deal with surface emission
 - Experimenting with GFS model profiles as a priori information (oceanic conditions vs. land-based radiosondes)
- JPL team testing a new retrieval method
 - MERRA global reanalysis for a priori data
 - Forward radiative transfer model to include surface effects
 - Retrieval framework using Optimal Estimation Theory (1D-VAR) for inversion; iterative retrieval
 - CSET flight provided for testing

Other CSET Radiometers

- Kipp & Zonen CMP22
 - Shortwave irradiance
 - Down-looking
 - var name VISB
- Kipp & Zonen CGR4
 - Longwave irradiance
 - Up- and down-looking
 - var names IRBC, IRTC
- Heitronics KT19.85
 - Infrared radiometric surface temperature
 - Var name RSTB
