

Assessing Transport Pathways during HIPPO using Chemical Tracers

Jasna Pittman, Bruce Daube, Eric Kort, Steve Wofsy, *Harvard University*
Ru-Shan Gao, Ryan Spackman *NOAA*
Laura Pan, Leigh Munchak *NCAR*

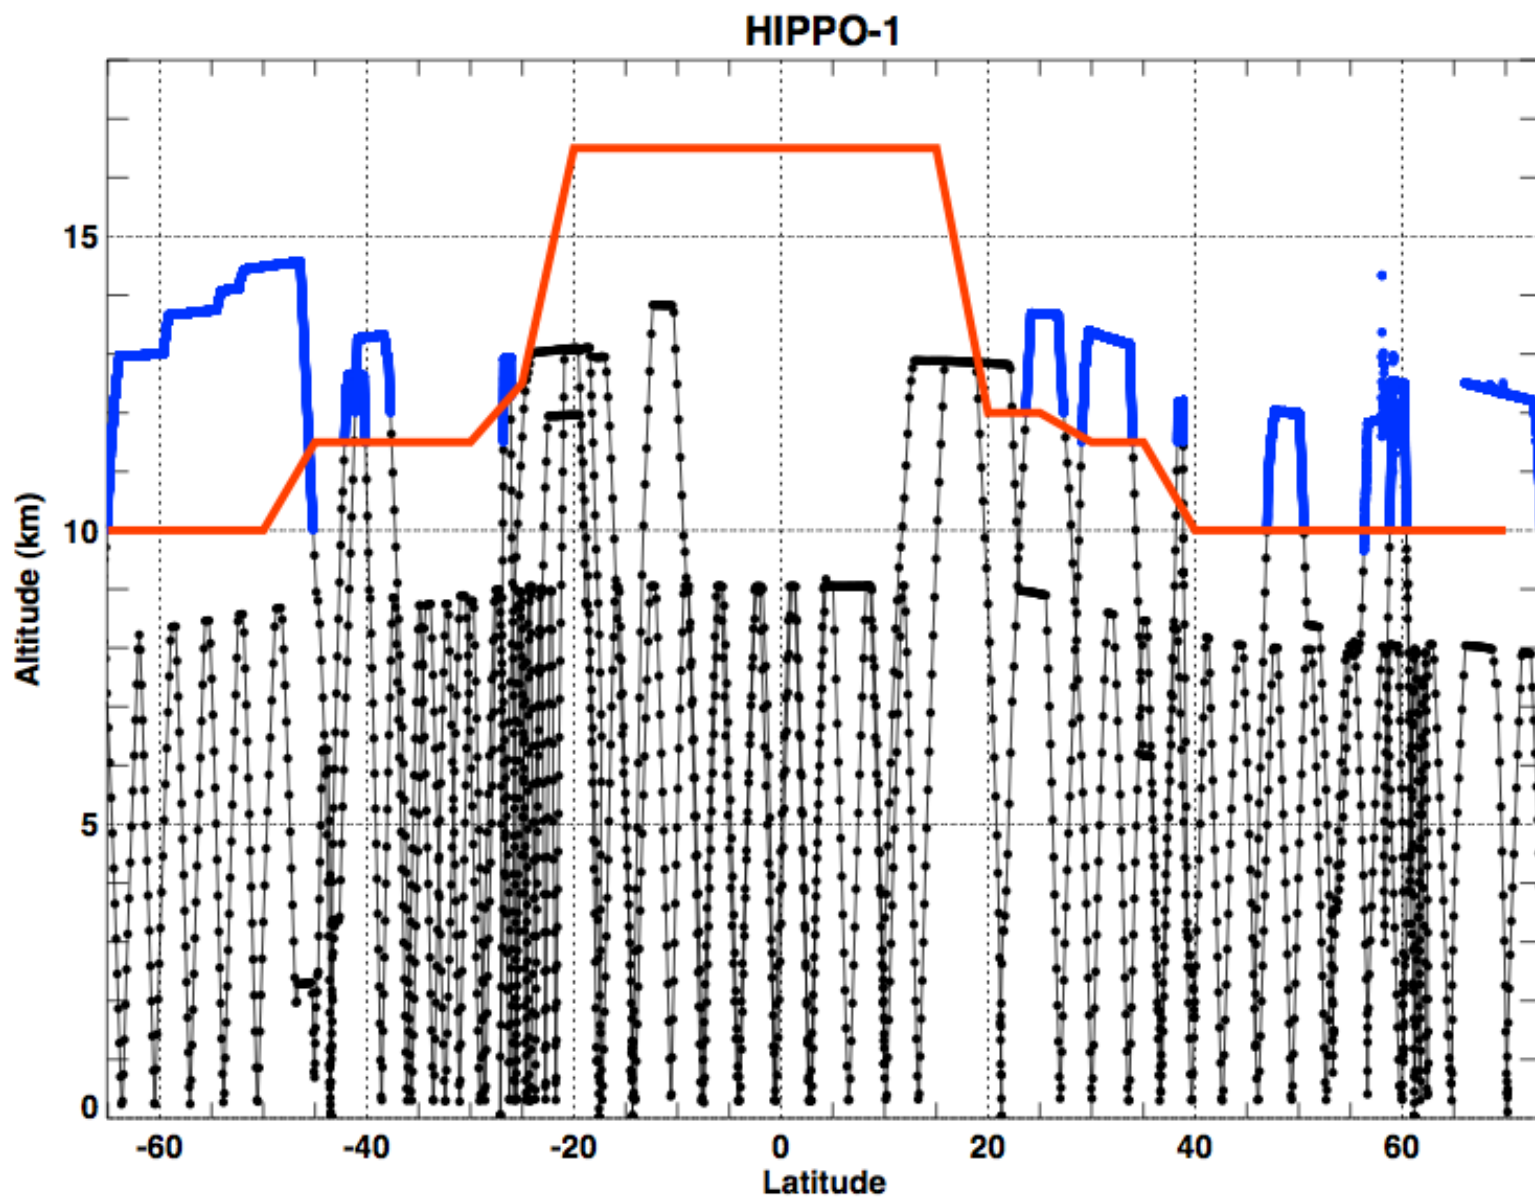

HIPPO Workshop
March 17, 2011

Outline

- ✦ Examine O_3 / CO correlations throughout troposphere and UT/LS:
 - ✦ O_3 -> tracer of stratospheric origin
 - ✦ CO -> tracer of tropospheric origin
- ✦ Map preferred regions of positive and negative correlations
- ✦ Characterize the observed correlations as a function of underlying transport, photochemical processes, hemispheric asymmetry, and seasonal dependence

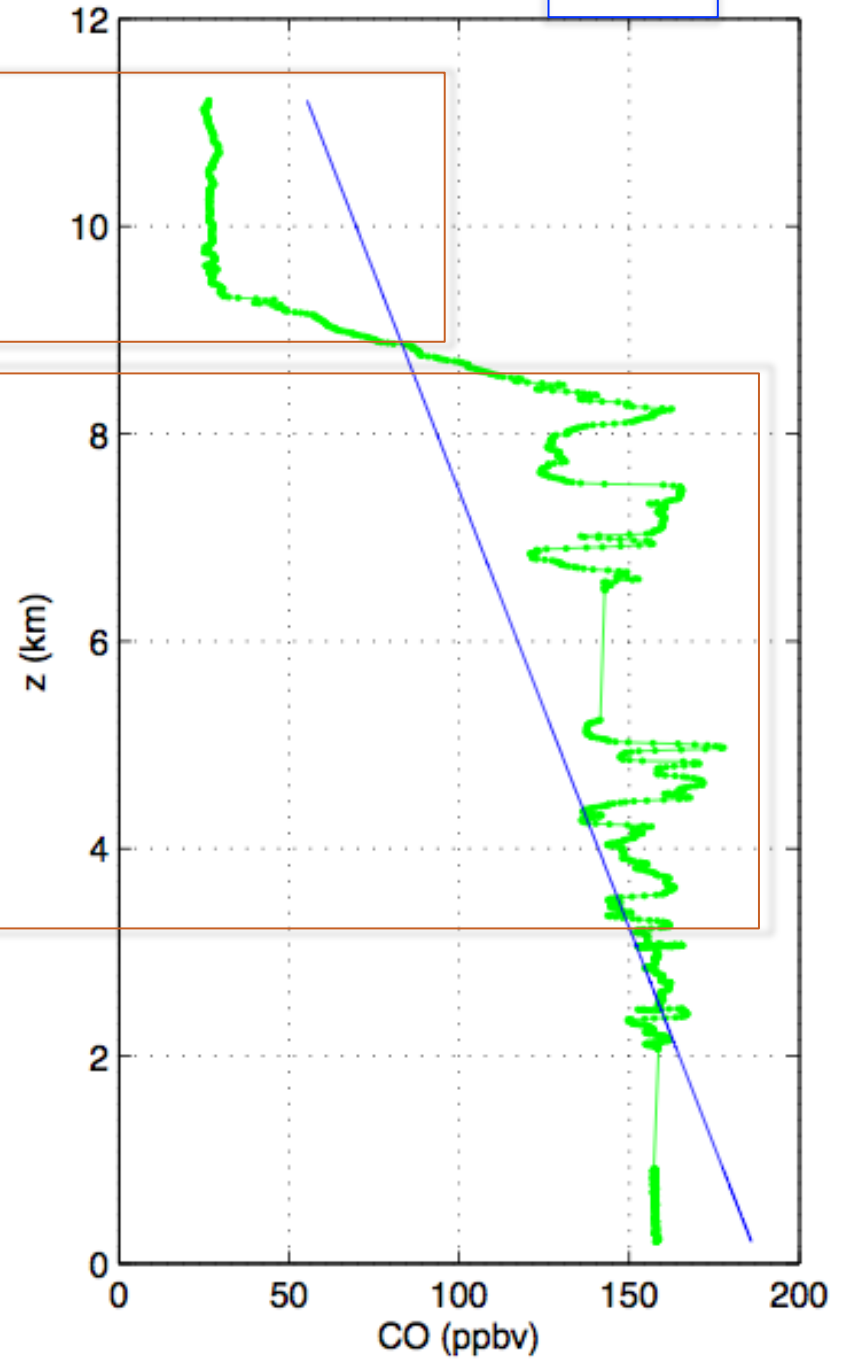

HIPPO Flight Tracks

num prof=19 at avg lat=55.8042

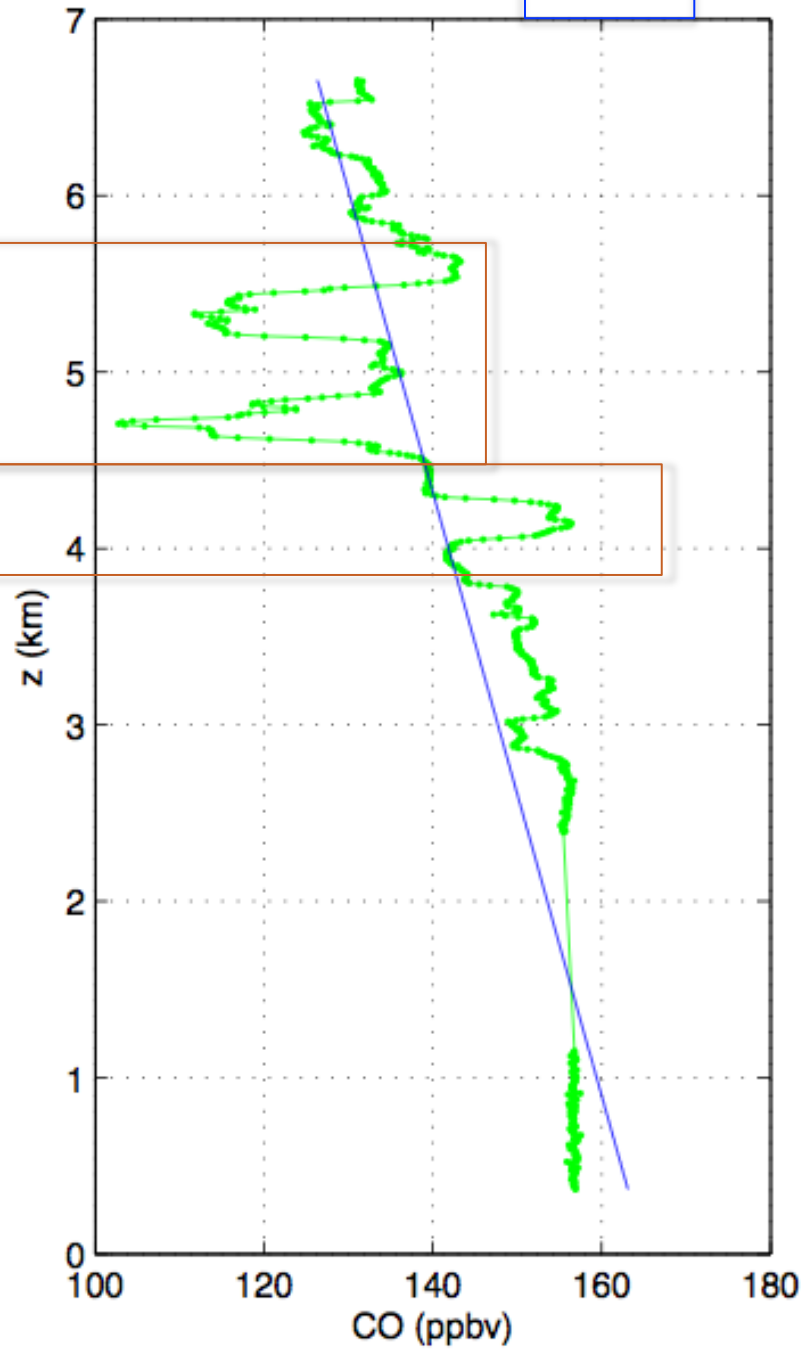

normalized corr coef = -0.99158

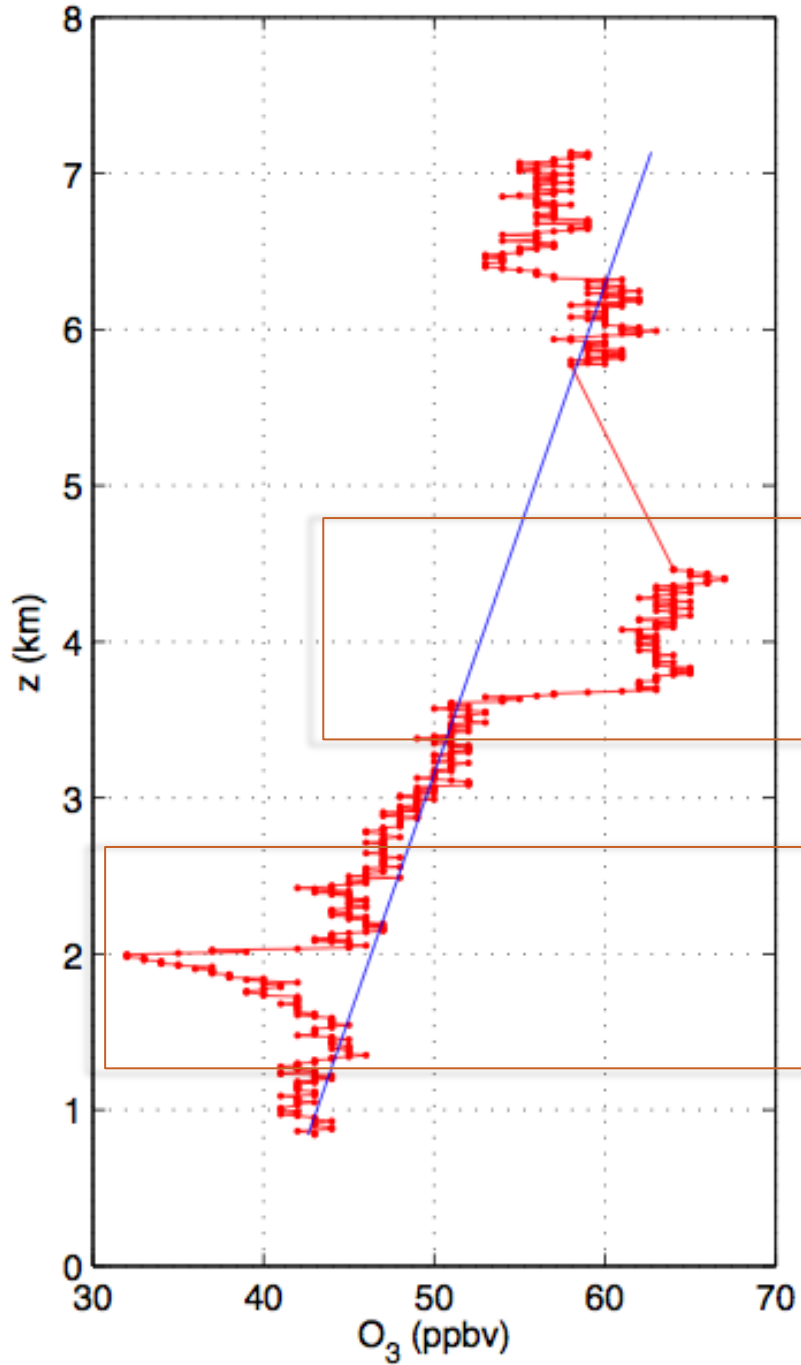

num prof=21 at avg lat=53.154

normalized corr coef = -0.87055

num prof=3 at avg lat=53.7234

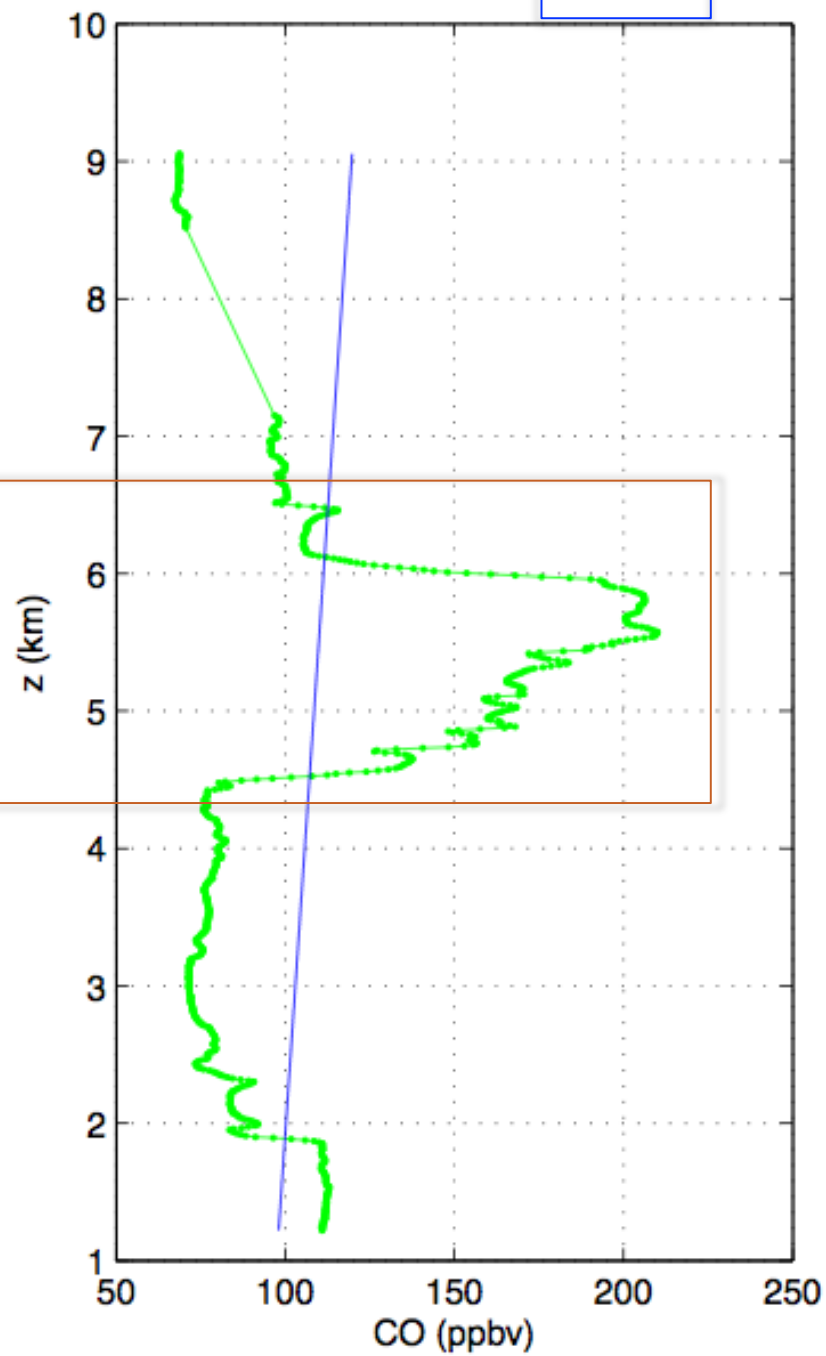

normalized corr coef = -0.4762

num prof=39 at avg lat=11.5193

normalized corr coef = 0.98447

HIPPO-1
January 2009

HIPPO-2
Oct/Nov 2009

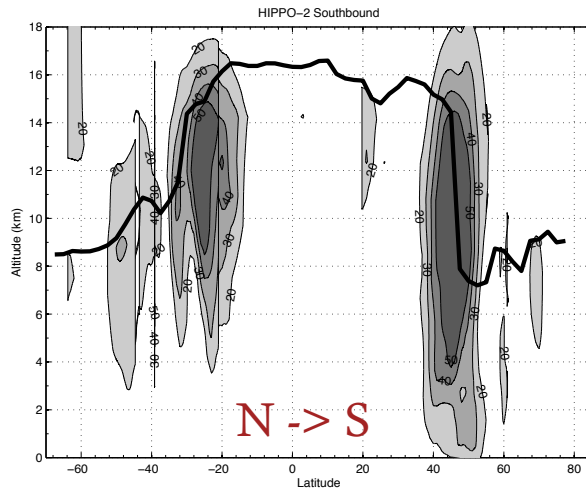

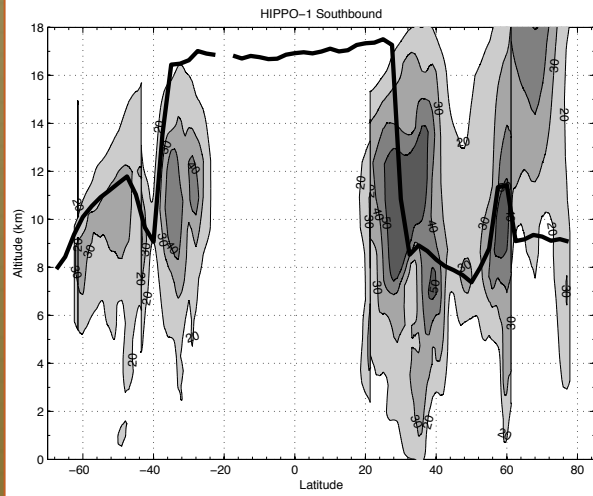

HIPPO-3
Mar/Apr 2010

HIPPO-1

HIPPO-2

HIPPO-3

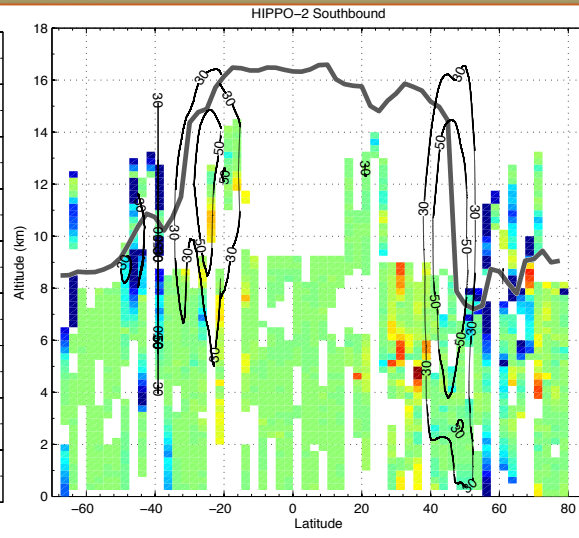

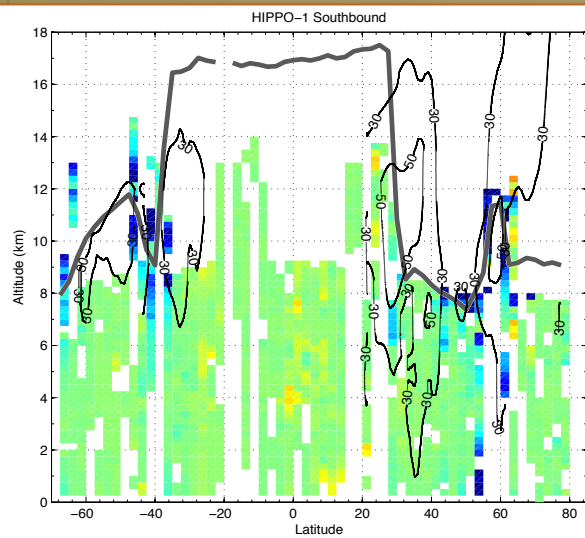

Winds

HIPPO-1
142 profiles

HIPPO-2
141 profiles

HIPPO-3
124 profiles

Southbound Legs

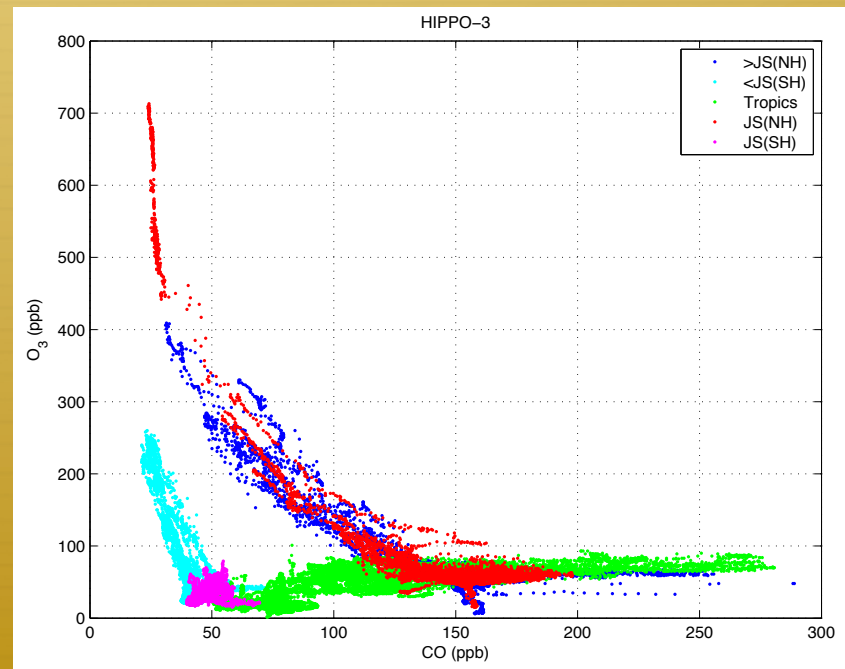

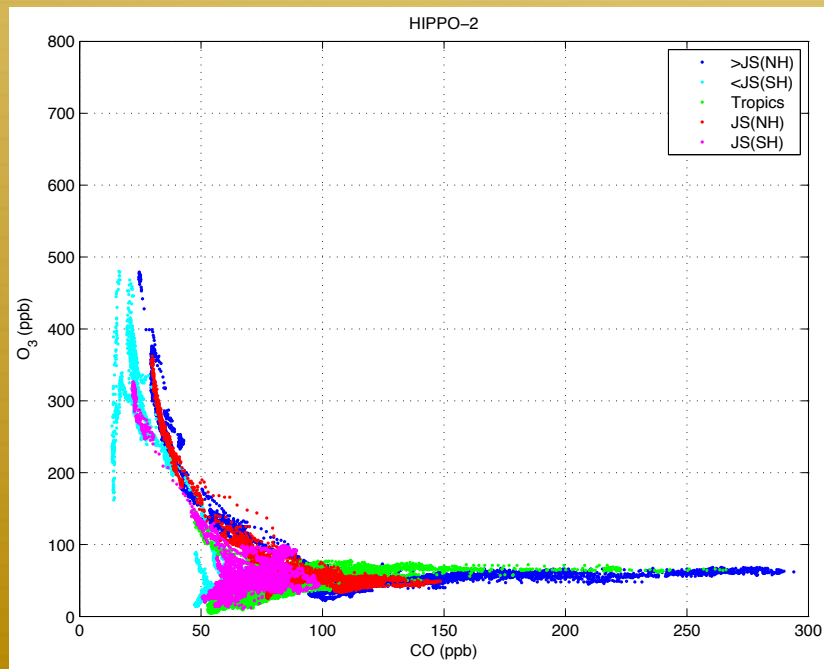

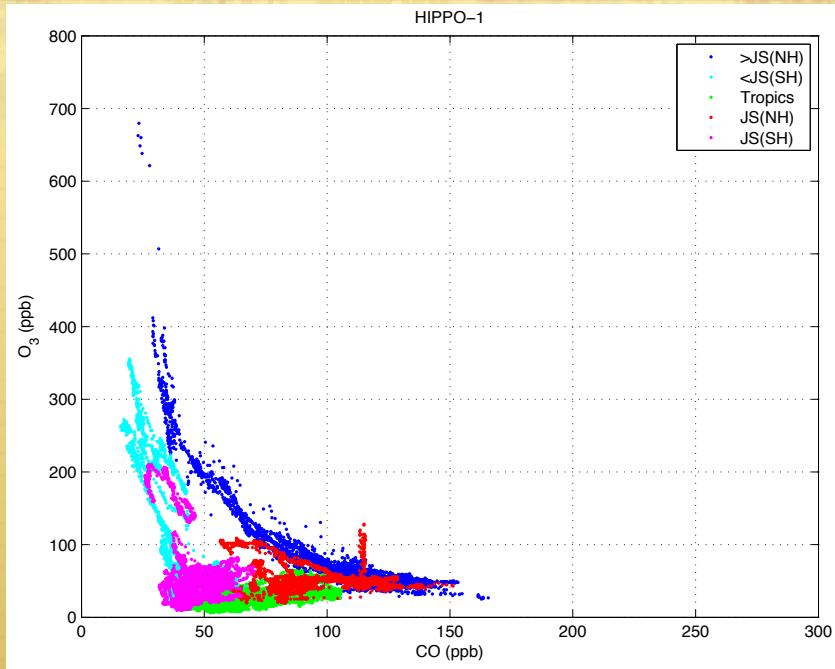

HIPPO-1

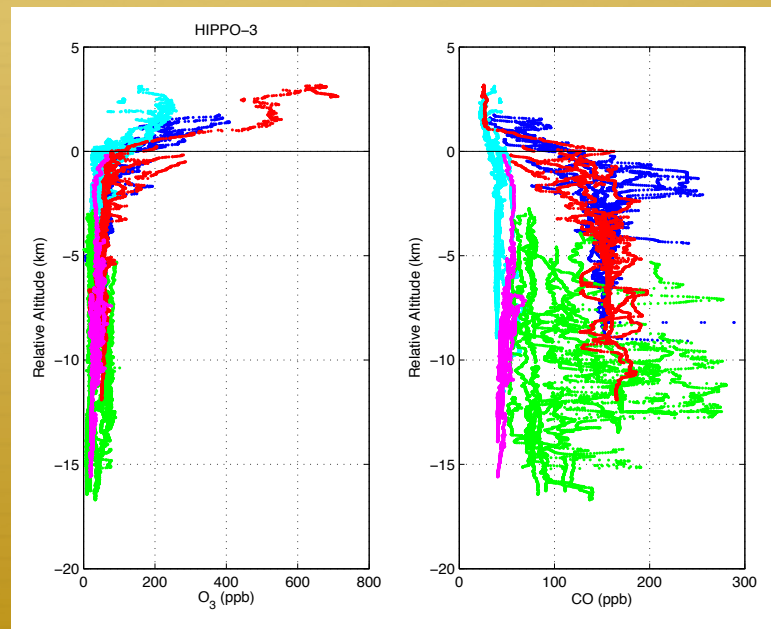

HIPPO-2

HIPPO-3

Summary

- ✦ Correlation residuals from O_3 / CO vertical profiles provide a tool to illustrate transport and photochemical processes during HIPPO.
- ✦ O_3 / CO anti-correlations provide evidence of stratospheric air in the UT (at higher latitudes and around the jet stream) and of boundary layer pollution.
- ✦ O_3 / CO positive correlations could be explained by in situ photochemical production, mainly found throughout the tropics.
- ✦ Seasonal variability in transport and photochemical processes is evidenced by changes in the distribution of these trace gases.
