

Pouch-tracking lessons learned
and
circulation characteristics of
ex-Gaston, pre-Karl, and pre-Matthew
as derived from the GV dropsondes

Mark Boothe and Mike Montgomery

Naval Postgraduate School

Zhuo Wang

University of Illinois

Two Years of Pouch-Tracking

	2009	2010
Period	7/20-10/11	6/2-10/31
	84 days	152 days
Features	34	68
TDs+	9	19
	26% of total	28% of total
TSs+	8	18

Different wave scenarios (Wang & Montgomery, Miami, 2009)

- Retrospective analysis of the waves in 2009:
 - Fast propagating waves without a pouch
 - Faster than the mean flow
 - Waves with a shallow pouch
 - Waves with a deep pouch that did not develop
 - Inhibited by dry air
 - Waves with a deep pouch that developed
 - Can be enhanced by interaction with ITCZ

Unusual scenarios 2010

- Monsoonal influence
 - Hermine
 - PGI50L - Nicole?
 - PGI44L - Karl?
- Models forecast the development of a new pouch to the northwest of a current Central Atlantic system ... Usually a false alarm
 - http://www.met.nps.edu/~mtmontgo/storms2010/PGI46L/2010091600/ukmet/PGI46L_OW_UKMET_2010091600_loop.html
 - http://www.met.nps.edu/~mtmontgo/storms2010/PGI46L/2010091600/ecmwf/PGI46L_OW_ECMWF_2010091600_loop.html

Question: Does an OW threshold of $2 \times 10^{-9} \text{ s}^{-2}$ in the model forecast indicate likelihood for development?

Analysis of ECMWF

- The 2010 ECMWF forecasts of pouches with at least one 12-hourly position
- 243 forecasts (15 July – 27 October)
- Number of forecasts is skewed toward developers because they tend to last longer
- No account for the time of development
- Simple count of the maximum OW at any time during each 120-hour forecast
- Examine only the 700 hPa values for consistency, even if eventually tracked at a lower level

Question: Does an OW threshold of $2 \times 10^{-9} \text{ s}^{-2}$ in the model forecast indicate likelihood for development?

ECMWF Dividing Streamline Analysis 2010090300

RF09 Drops: 20100902 1532-1906 Z 4:54-8:28 hours before

Outer points are used to create a circulation path

Circulation

$$C = \oint \mathbf{v} \times d\mathbf{l}$$

Average vorticity
 C / area

Average tangential cyclonic wind
 $C / \text{perimeter}$

Holton, An Introduction to Dynamic Meteorology (2nd)
Figure 4.1

Circulation

Determine midpoints between the drops.

Heading of dl is average of the headings of the two adjacent perimeter segments with the midpoints as the endpoints.

Wind values are simply read from the drop files. Some interpolation required (usually within 1 hPa).

Calculation at each point used the distance between the adjacent midpoints.

Sept 20 – Convection to east

RF20: Average Tangential Cyclonic Velocity (m/s)

Sept 21 – Convection surrounds pouch

RF21: Average Tangential Cyclonic Velocity (m/s)

Sept 22 – Convection closer to center

RF22: Average Tangential Cyclonic Velocity (m/s)

Sept 24 – Tropical storm

RF23: Average Tangential Cyclonic Velocity (m/s)

Sept 20-22

- Consistently cyclonic up to 400 hPa
- Wind max initially at 750 hPa, drops slightly to 800 hPa, but is strong throughout 600-900 hPa layer by Sept 22

Sept 24 ... Now a TS

- Winds are not that different from two days prior, with some values even less (because we missed the western side?)

Comparison of Last Flights

Gaston
Sept 7

Karl
Sept 14

Matthew
Sept 24

- Gaston's maximum winds not much less than other two storms, but they are confined to a shallow layer
- While Gaston is cyclonic up to only 700 hPa, Karl and Matthew are cyclonic up to 400 hPa

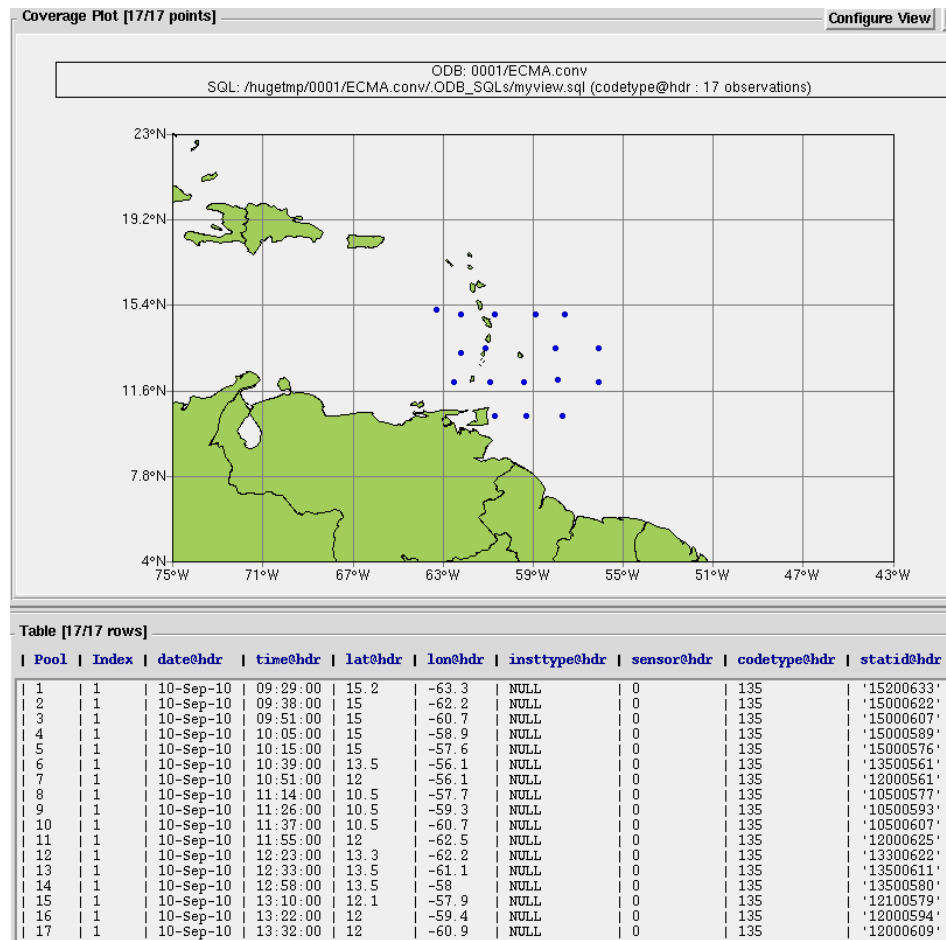

Future Kinematics Work

- Complete calculations for:
 - Non-developers PGI27, PGI30, PGI48(?)
 - Developers PGI36/Fiona and PGI50/Nicole
- Calculate convergence/divergence with similar techniques
- Make same calculations for smaller regions to focus on the meso- α scale

Other projects

- Test ECMWF by rerunning the model without the dropsondes (Peter Bauer, Head of Satellite Section/Research Department, ECMWF)

Other projects

- Accepting ideas for improvements and additions to the Montgomery pouch product suite and website (Saurabh Barve, NPS)

Plan for my Summer Vacation 2011

Track pouches! July - October

No big changes from last year

- Four models: ECMWF, GFS, UKMET, NOGAPS

NOT OBJECTIVE:

- Initiation of a pouch
- Determination of the phase speed
 - Weak RH & v Hovmoller signal for weak pouches
 - Sometimes Hovmoller “appears” to change speed during the 5-day forecast
- Track plotting
