

# May 2014 NOMADSS meeting

Can wavelet analysis be used to get a higher spatial resolution on OH calculation from isoprene flux gradients?

Lisa Kaser

# Experiment (PTR-MS during NOMADSS)

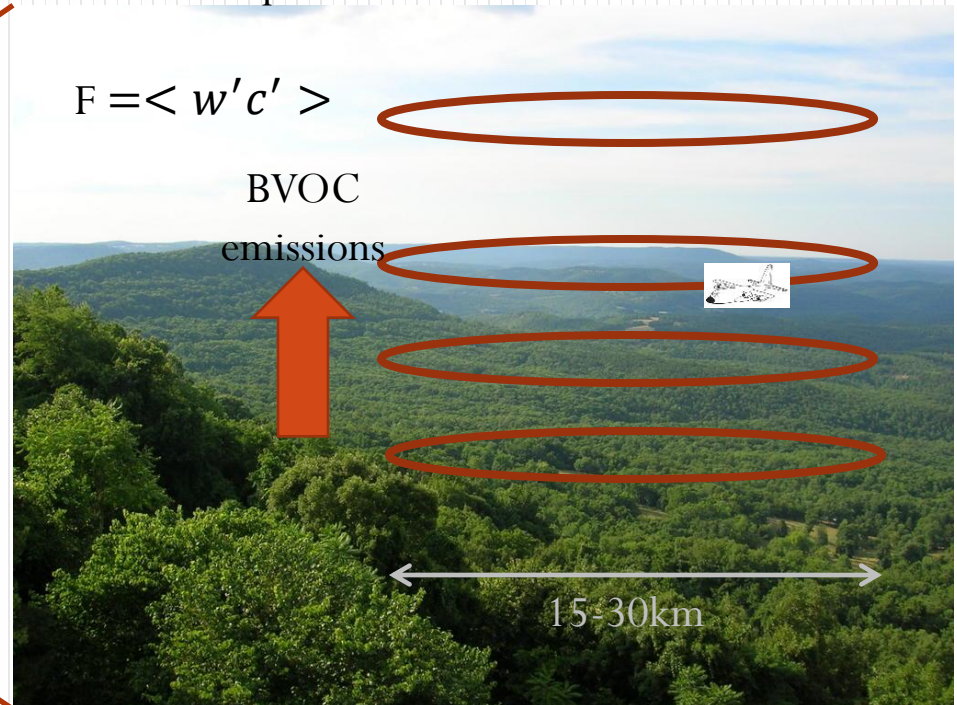

- Fast (25Hz) 3D wind measurements
- Fast (10Hz disjunct) PTR-MS VOC measurements (**Isoprene**, MVK+MACR, sum of Monoterpenes)

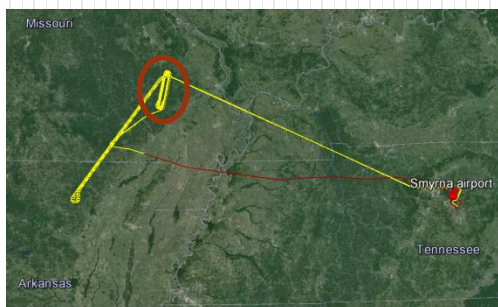

$$F = \langle w' c' \rangle$$

BVOC  
emissions

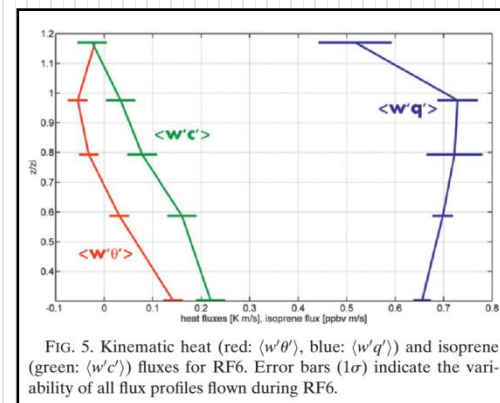

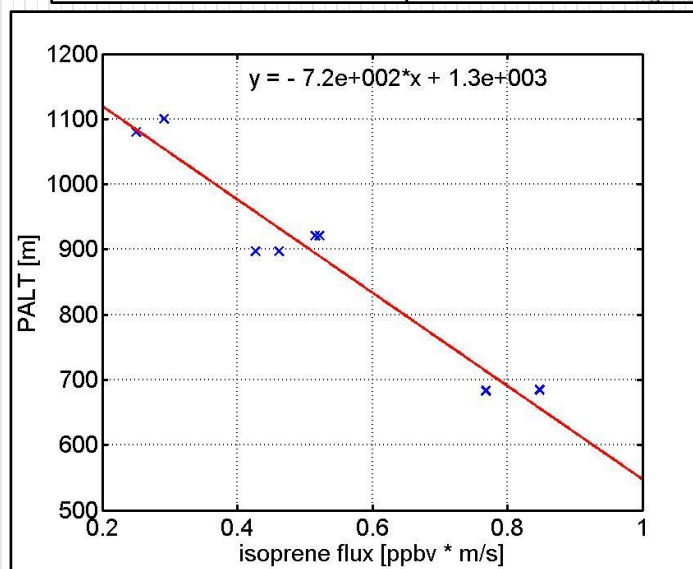

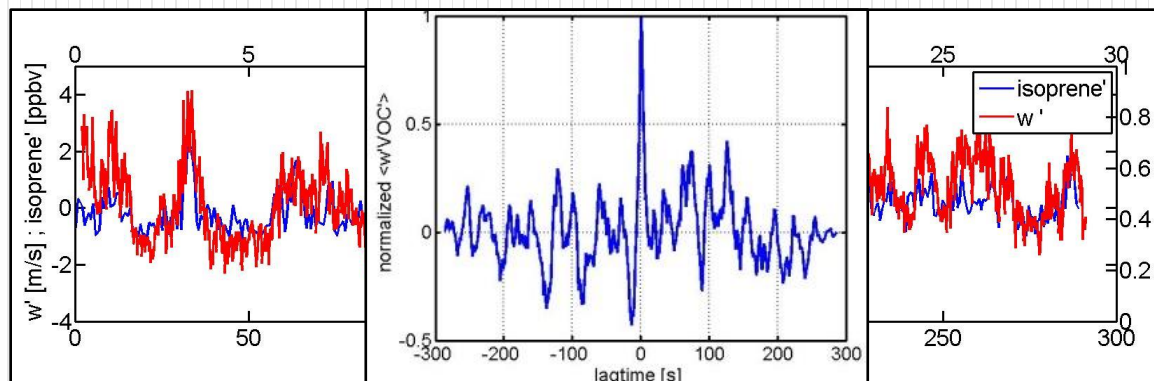

# 'Traditional' - OH from eddy covariance

- Each of the legs needs to be analyzed separately!
- RF 17: 5 heights, 20 legs

- **One** OH density value can be calculated for the whole area. **Time and space averaged.**
- RF17:  $7.4 \times 10^6 \pm 2.2 \times 10^6$  molecules/cm<sup>-3</sup>  
(isoprene lifetime 23min)

Karl et al. 2013

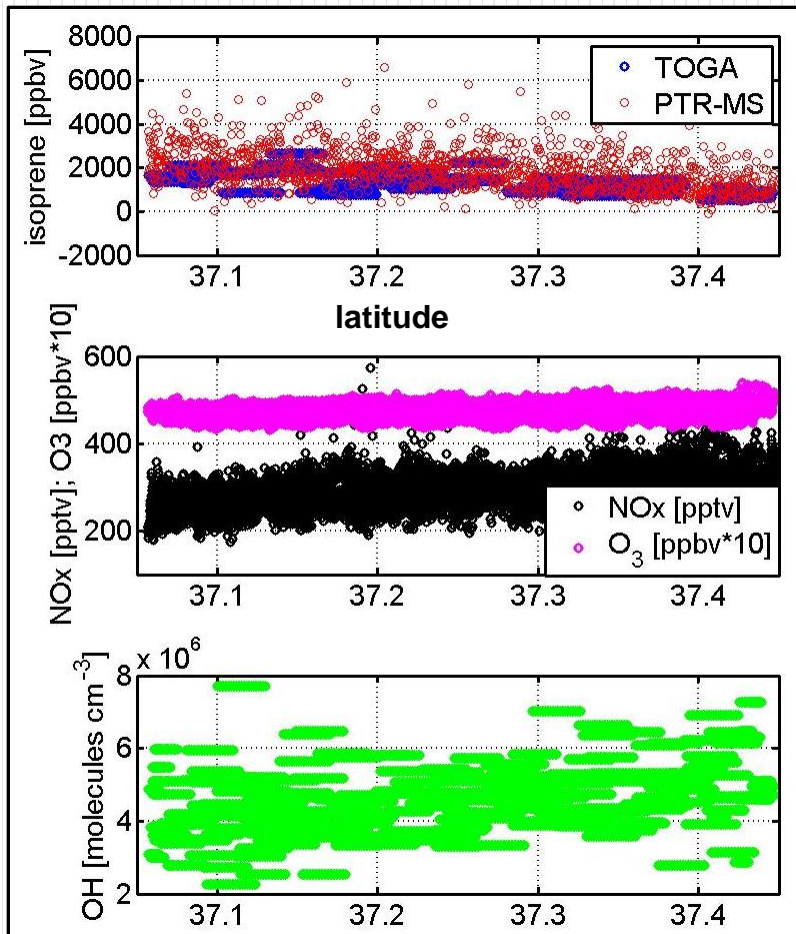

$$\frac{dC}{dt} + \frac{dF}{dz} = \frac{C}{\tau} \Rightarrow \text{isoprene lifetime}$$

$$\tau = \frac{1}{k_{OH}[OH] + k_{O_3}[O_3] + k_{NO_3}[NO_3]}$$

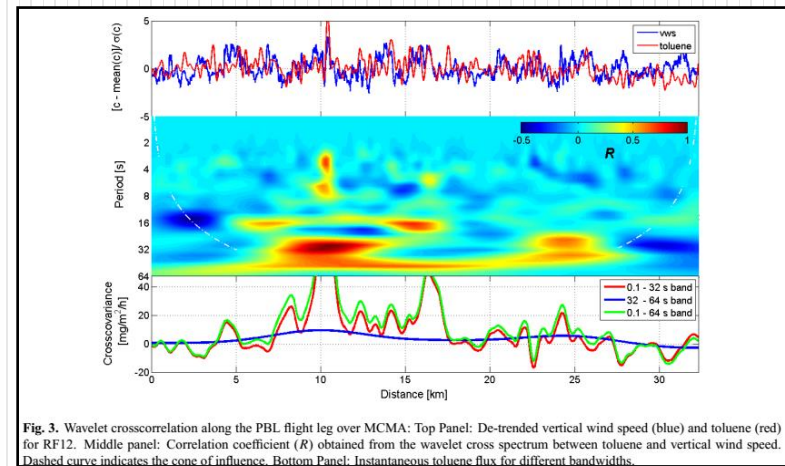

$\Rightarrow [OH]$  density

$$k_{OH} = 2.5 \times 10^{-11} * e^{410/T} \frac{cm^3 s}{molec.}$$

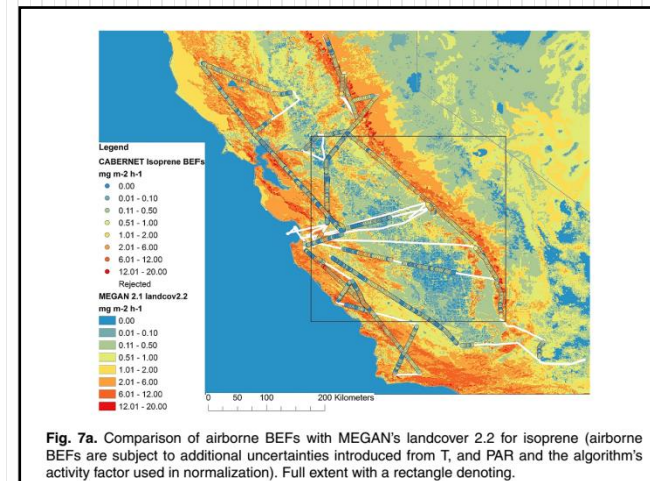

# Motivation for OH from wavelet analysis

Concentration gradients  
observed over the racetrack
