Overview

- VOC results from a research voyage over the South West Pacific (Surface Ocean Aerosol Production)
- Dicarbonyl (incl glyoxal) surface observations over South West Pacific (SOAP voyage), Southern Ocean (Cape Grim Baseline Station)
- Long term aerosol chemical composition record from Cape Grim

SOAP measurement summary

	Measurement	Organisation
Air Sea Exchange	CO ₂ / DMS flux	NIWA, NUIG Ireland, UC Irvine US, IFM-G Germany, U Chapman US, SUNY US
Ocean Biology/ biogeochemistry	SST, Diss. DMS, DMSP, pH, DOM characterisation	NIWA, U Laval Canada
	Chlorophyll-a, bacterial & phytoplankton density/ composition, bacterial enzyme activity, nutrients	NIWA
Atmospheric chemistry	Aerosol nuclei production Aerosol chemical composition (filters) Aerosol size distribution/count Black carbon Cloud condensation nuclei (CCN)	UEF Finland NIWA QUT NIWA CSIRO CMAR
	Atmospheric DMS	UC Irvine, NIWA, CSIRO CMAR
	Halocarbons, I ₂ , halogen oxides	NIWA University Cambridge
	Volatile organic compounds	CSIRO CMAR

“Baseline” switch developed
to avoid sampling
concentrated ship exhaust

Proton Transfer Reaction Mass Spectrometer (PTR-MS)

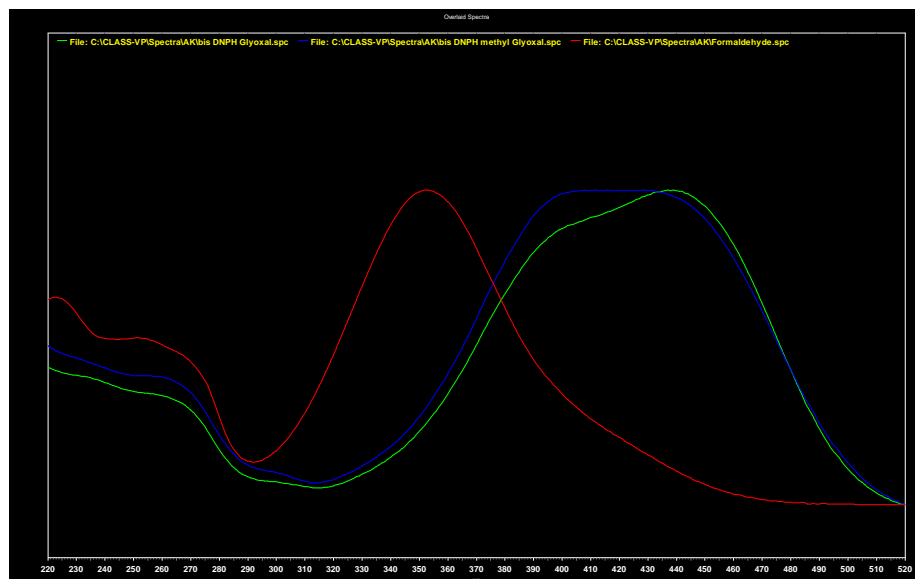

- Online chemical ionisation mass spectrometer
- Ion Source > 98% H_3O^+ (reagent ion) <2% O_2^+
- Primary reaction is:
$$\text{VOC} + \text{H}_3\text{O}^+ \rightarrow \text{VOCH}^+ + \text{H}_2\text{O}$$
- detects compounds with proton affinities (PA) greater than H_2O
- Calibrated for formaldehyde, methanol, acetonitrile, acetaldehyde, acrolein, acetone, DMS, isoprene, methacrolein, methyl ethyl ketone, benzene, toluene, m-xylene, tri methyl benzene and alpha-pinene
- several 'zero' measurements per day to determine background signal from interference ions (O_2^+ , NO^+ , water clusters) and out-gassing from materials
- Detection limits low ppt to 10s of ppt

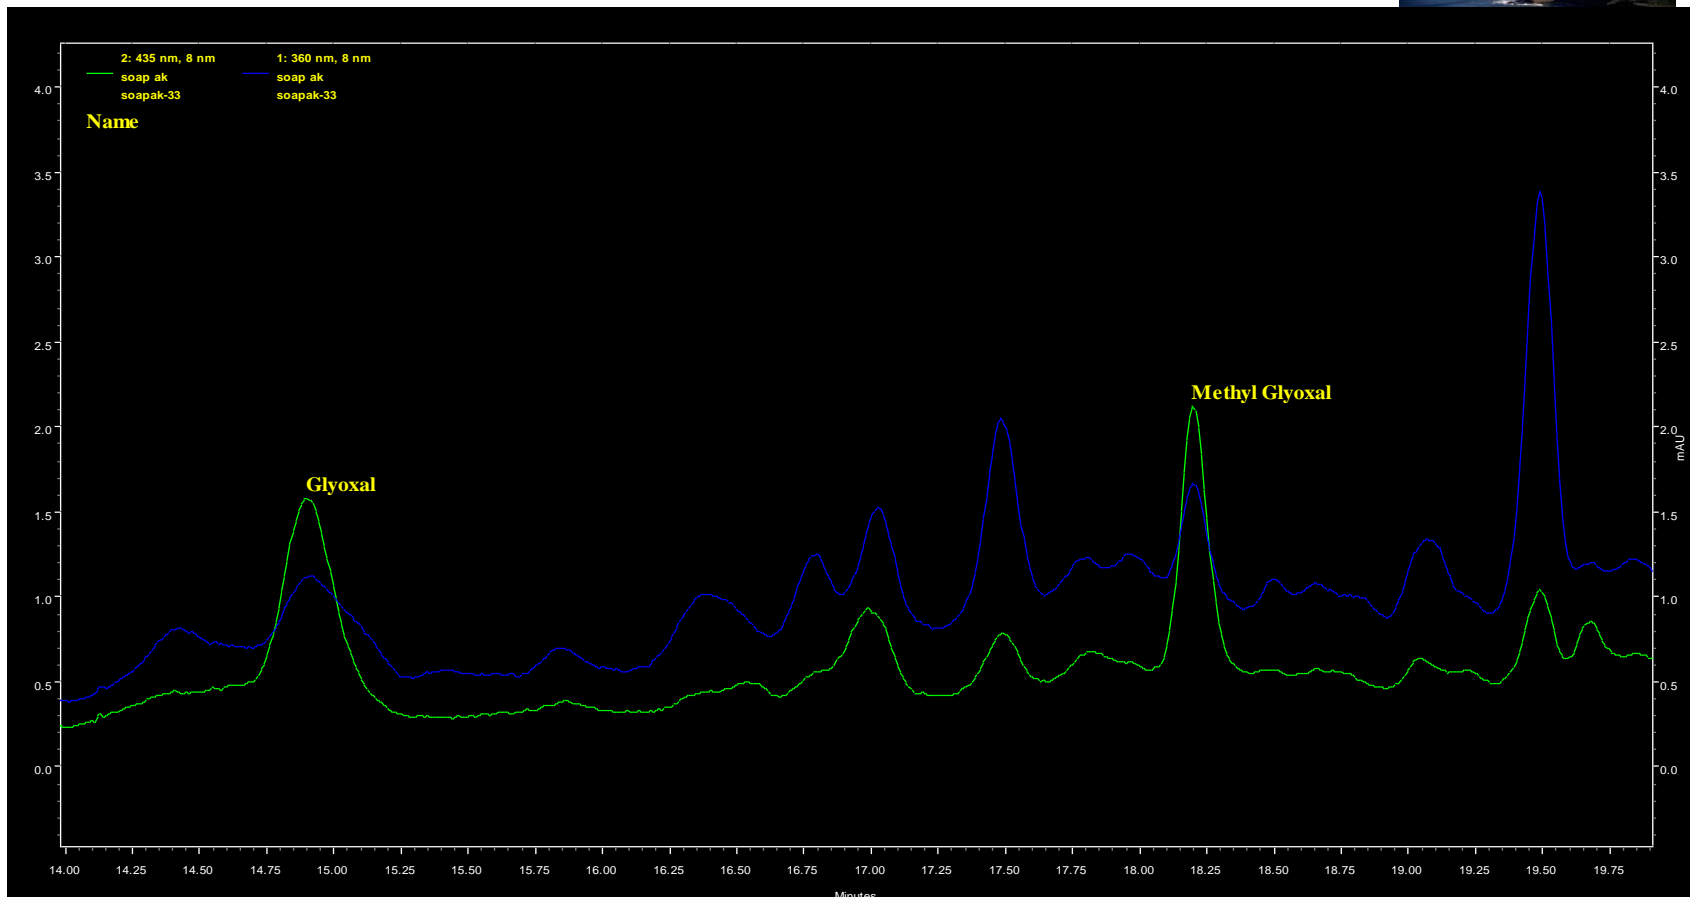

Carbonyl measurement – DNPH cartridges

- Aldehyde, ketones (up to C8) and dicarbonyls trapped on silica adsorbent coated with 2,4-dinitrophenylhydrazine (2,4-DNPH), and converted to the hydrazone derivatives
- The derivatives are eluted from the cartridge in acetonitrile and analysed by HPLC with diode array detector (EPA Method TO11A)
- MDLs: 1-2 ppt glyoxal and methyl glyoxal for 24 hour sample

Red: formaldehyde - monocarbonyl (360nm)
Blue and green: glyoxal and methyl glyoxal - dicarbonyls (435nm)

Sample chromatogram at 360 and 435 nm

Sample chromatogram – blue 360m, green 435nm

Cape Grim - PM10- a 36 year record of MSA

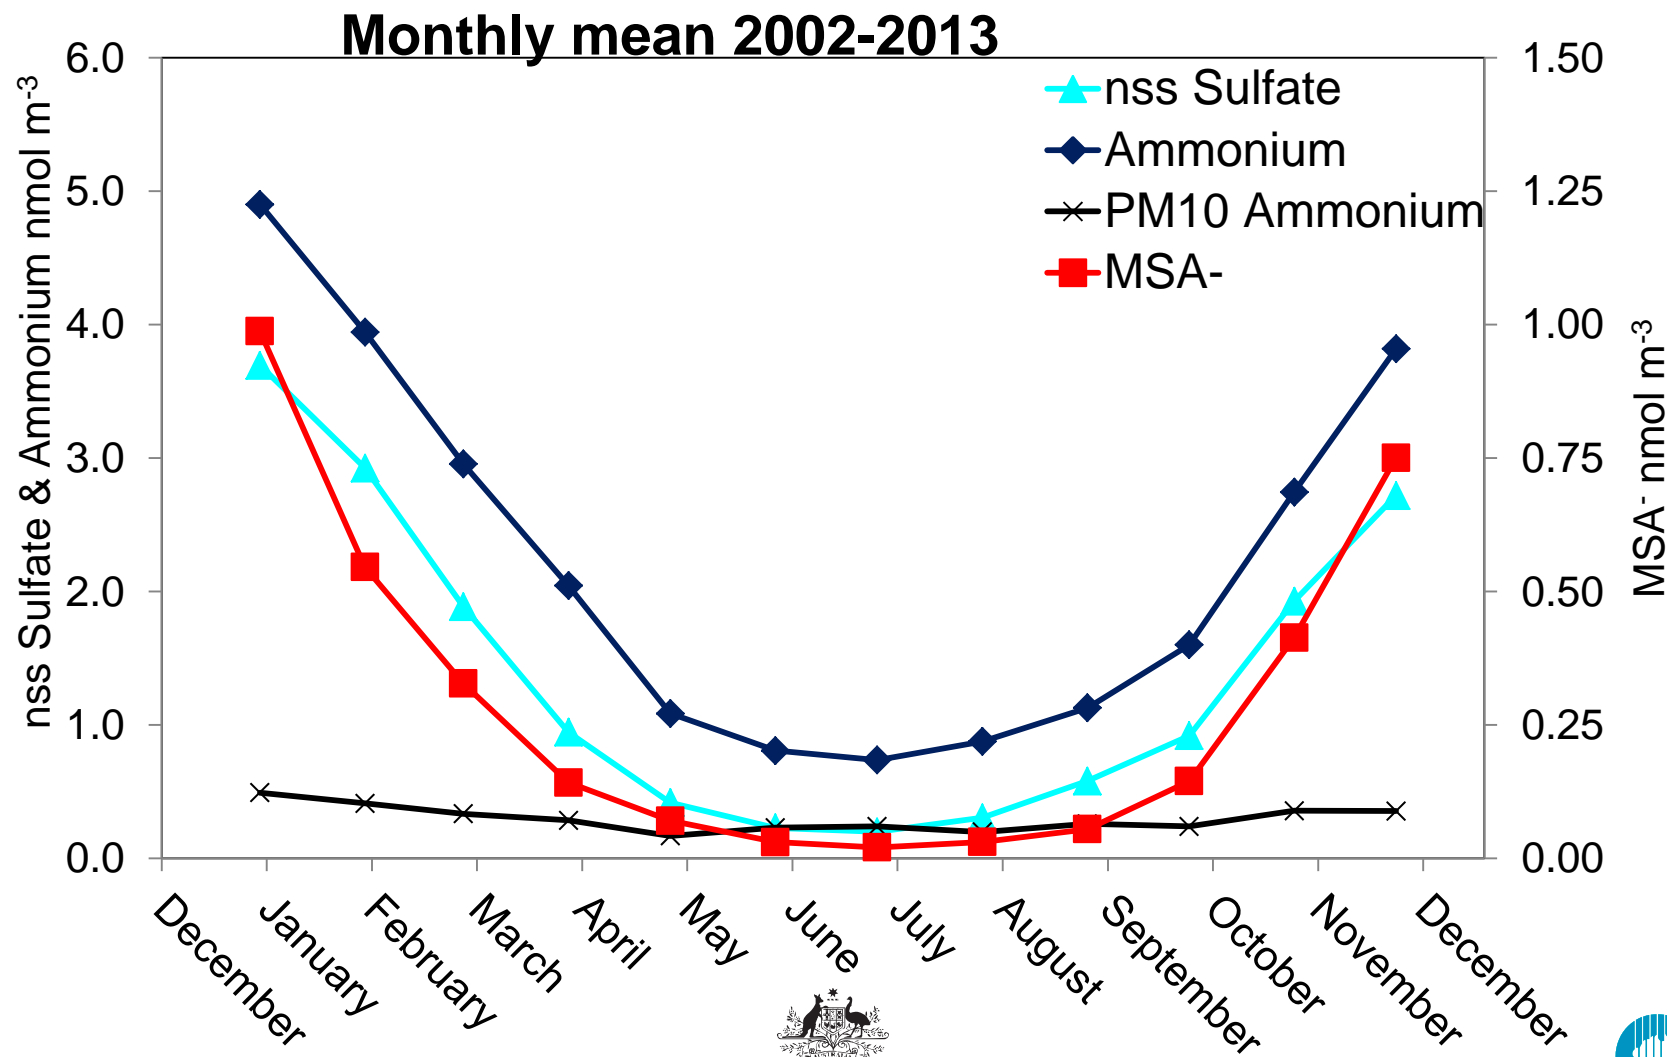

HiVol Coarse MSA-

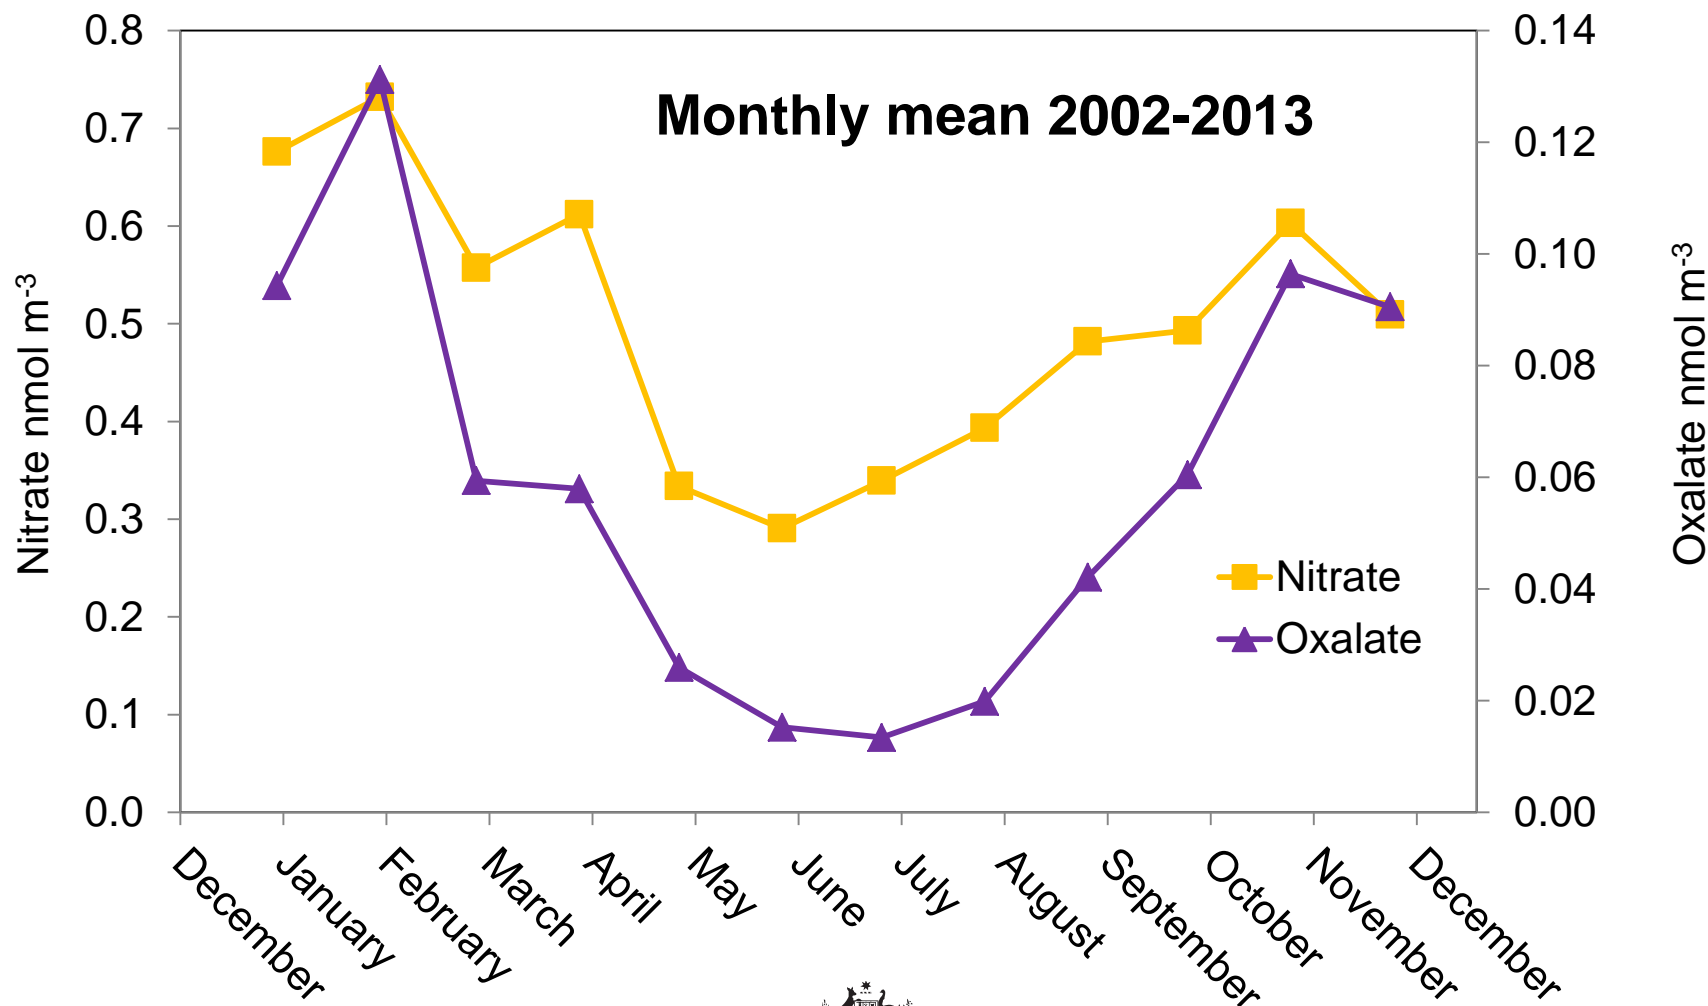

PM2.5 secondary species

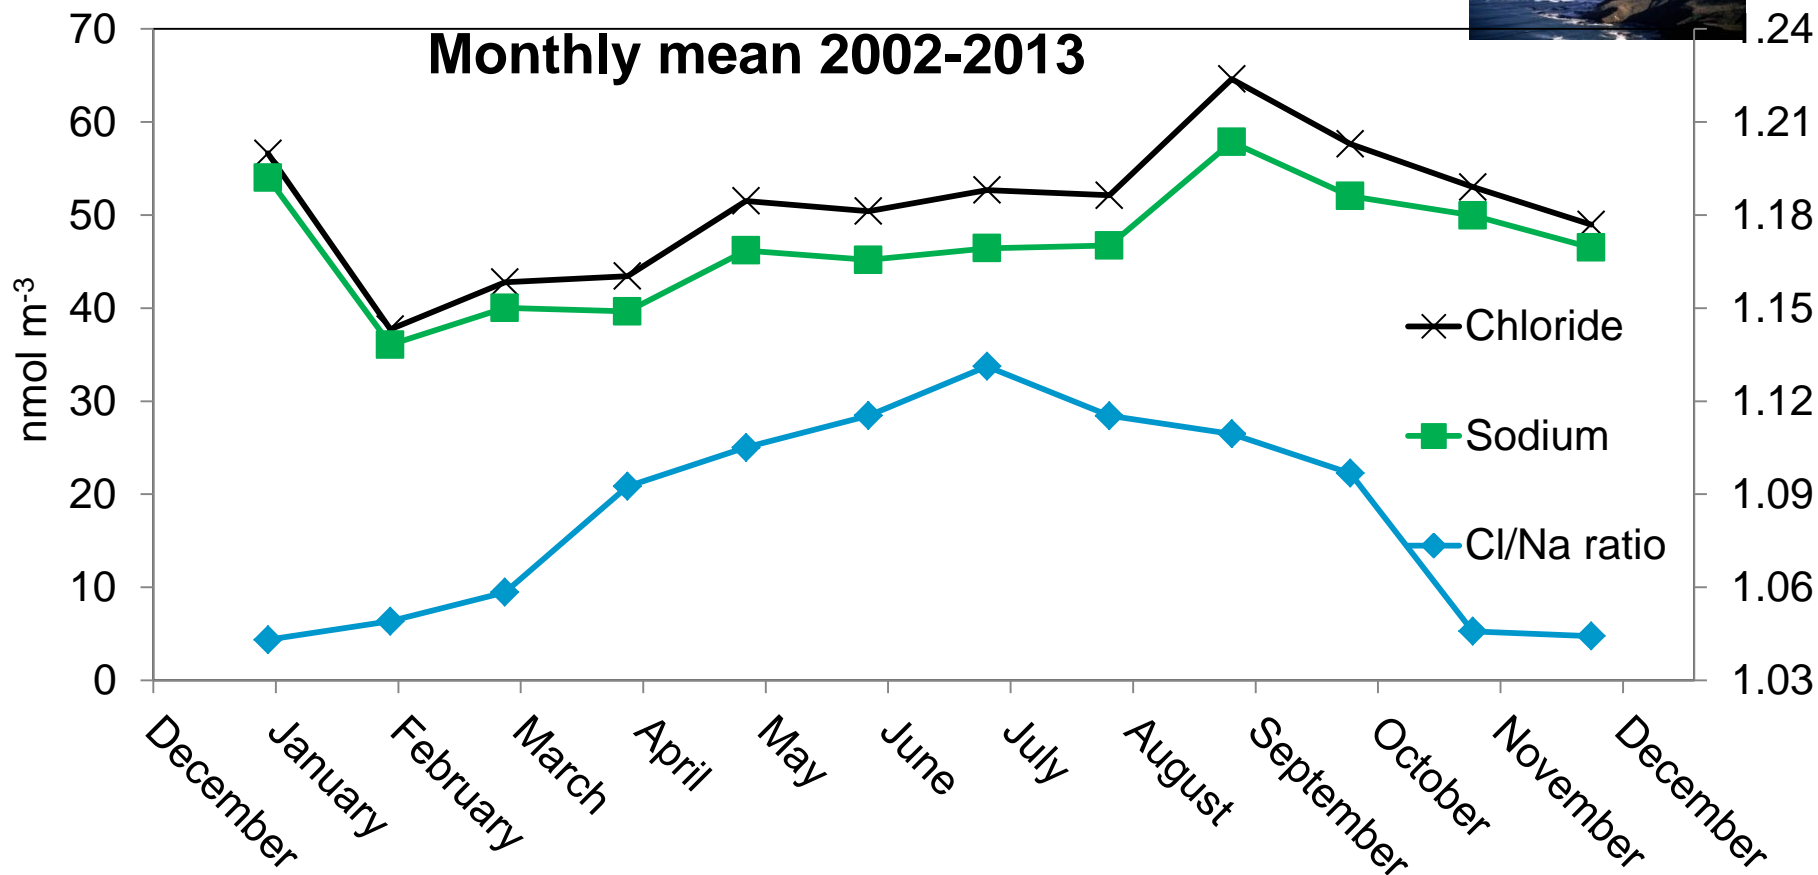

Seasonal cycles of secondary species

Seasonal cycles of secondary species

PM2.5 -Chloride loss in summer

- Winter Cl/Na ratio = seawater ratio
- Summer Cl/Na ratio \ll seawater ratio indicating chloride loss (displacement by sulfuric, nitric acid, photochemical reactions)

Unknown component of PM2.5

A proportion of the measured mass is not accounted for by water soluble species. This 10-20 % may be organics not detectable by ion chromatography

Australia's new Research Vessel - *RV Investigator*

- 93m ship, accommodates 40 scientists, 300 days at sea per year
- Dedicated atmospheric composition laboratories onboard
- Australian atmospheric community -commissioning voyages in ~ late 2014
- Great Barrier Reef as a source of atmospheric aerosol in 2015-16 (biogeochemistry, dissolved VOCs, atmospheric VOCs and halogen oxides, halocarbons, aerosol composition and properties, cloud properties)
